2008

Annual Financial Statements
2008

AngloGold Ashanti's theme for the 2008 suite of reports takes the form of installation art, reflecting the group's fundamental premise that 'People are our business, our business is people'. We recognise that it is the people of AngloGold Ashanti – employees, their families and our communities – that breathe life into the company, through their vision, energy, resourcefulness, strength and ingenuity.

OUR VISION

To be the leading mining company.

OUR MISSION

We create value for our shareholders, our employees and our business and social partners by safely and responsibly exploring for, mining and marketing our products. Our primary focus is gold and we will pursue value-creating opportunities in other minerals where we can leverage our existing assets, skills and experience to enhance the delivery of value.

OUR VALUES

Safety is our first value.

We place people first and correspondingly put the highest priority on safe and healthy practices and systems of work. We are responsible for seeking out new and innovative ways to ensure that our workplaces are free of occupational injury and illness. We live each day for each other and use our collective commitment, talents, resources and systems to deliver on our most important commitment ... to care.

We treat each other with dignity and respect.

We believe that individuals who are treated with respect and who are entrusted to take responsibility respond by giving their best. We seek to preserve people's dignity, their sense of self-worth in all our interactions, respecting them for who they are and valuing the unique contribution that they can make to our business success. We are honest with ourselves and others, and we deal ethically with all of our business and social partners.

We value diversity.

We aim to be a global leader with the right people for the right jobs. We promote inclusion and team work, deriving benefit from the rich diversity of the cultures, ideas, experiences and skills that each employee brings to the business.

We are accountable for our actions and undertake to deliver on our commitments.

We are focused on delivering results and we do what we say we will do. We accept responsibility and hold ourselves accountable for our work, our behaviour, our ethics and our actions. We aim to deliver high-performance outcomes and undertake to deliver on our commitments to our colleagues, business and social partners, and our investors.

The communities and societies in which we operate will be better off for AngloGold Ashanti having been there.

We uphold and promote fundamental human rights where we do business. We contribute to building productive, respectful and mutually beneficial partnerships in the communities in which we operate. We aim to leave host communities with a sustainable future.

We respect the environment.

We are committed to continually improving our processes in order to prevent pollution, minimise waste, increase our carbon efficiency and make efficient use of natural resources. We will develop innovative solutions to mitigate environmental and climate risks.

HIGHLIGHTS 1998 – 2008

AngloGold Ashanti Limited (AngloGold Ashanti) has produced a suite of complementary reports to communicate on all aspects of its operating and financial performance for the year 1 January 2008 to 31 December 2008.

The 2008 suite of annual reports includes:

- Annual Financial Statements which provides a comprehensive review of the year from operational, business and market perspectives.

- Abridged Annual Report 2008, and a CD containing the suite of annual reports and the four quarterly reports produced during 2008, which will be distributed to shareholders.

- Notice of Meeting 2008.

- Mineral Resource and Ore Reserve Report 2008.

- Report to Society 2008 which incorporates:

- An expanded, comprehensive web-based report that provides a broad overview of AngloGold Ashanti's sustainable development initiatives at all its operations.

- A condensed printed report based on the above.

- Country reports which provide an overview of operational and sustainable development initiatives in each country in which the group operates.

The entire suite of reports is available electronically at www.aga-reports.com. Hard copies of these reports can also be requested from the contacts detailed at the end of this report.

Business partners and other interested parties with whom the company seeks to communicate include shareholders, investors, employees and their representatives, the communities in which AngloGold Ashanti operates, and regional and national governments.

The Annual Financial Statements 2008 were prepared in accordance with International Financial Reporting Standards (IFRS), the South African Companies Act No. 61 of 1973 and the Listings Requirements of the JSE Limited (JSE). The guidelines of the King Report on Corporate Governance 2002 (King Code) were also taken into account in compiling both the Annual Financial Statements 2008 and the Report to Society 2008. The latter was produced in accordance with the Global Reporting Initiative (GRI) and the principles of the International Council of Metals and Mining (ICMM) and the UN Global Compact, both of which AngloGold Ashanti is a member. The Annual Financial Statements are submitted to the JSE and to the London, New York, Ghanaian and Australian stock exchanges as well as to the Paris and Brussels bourses. They are also submitted to the US Securities and Exchange Commission (SEC) on Form 6-K.

In addition to the Mineral Resource and Ore Reserve Report 2008, the Annual Financial Statements 2008 contain a summary of the group's Mineral Resources and Ore Reserves. Mineral Resources and Ore Reserves in both documents are reported in accordance with the South African Code for Reporting of Mineral Reserves and Resources (SAMREC 2000) and

the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC 2004). Competent persons in terms of these codes have prepared, reviewed and confirmed the Mineral Resources and Ore Reserves reported.

Unless otherwise stated, \$ or dollar refers to US dollars throughout this report.

•

References to “group” and “company” are used interchangeably in the narrative, except in the financial statements of the group and company.

Please refer to the section on Non-GAAP disclosure and the Glossary of Terms on pages 332 and 339 respectively to familiarise yourself with the terminology used in this report.

Significant events during 2008

DEAR SHAREHOLDER

The past year represented a milestone year for AngloGold Ashanti – one in which we believe we delivered on a number of restructuring commitments that have positioned us well as we look to the future. As gold continues its strong price performance we have continued to remodel our operations, the balance sheet and our management to help position us to deliver increasing and sustainable value to our shareholders through 2009 and beyond.

Gold has performed remarkably well over the difficult second half of 2008 and into 2009 in the face of the international financial crisis and market volatility. Against the trend that many might have anticipated, gold has held its ground in the face of a strengthening US dollar, sharp falls in the prices of oil and other key commodities, and declining inflation. Even as gold jewellery demand has fallen in response to the economic crisis, investment demand for gold (and gold shares) has increased. This demand is driven by gold's status as a safe haven amidst the uncertainties caused by the worldwide financial crisis and fears regarding the possible consequences of government interventions to support banks and stimulate consumer demand.

External economic developments and a range of corporate challenges tested our company to the fullest extent. But under Mark Cutifani's first full year at the helm of AngloGold Ashanti, these challenges were fully met.

Mark has truly reinvigorated this company, positioning it to take full advantage of the opportunities which lie ahead. The year saw a further remodelling of the executive management, designed to enhance project and technical performance and thus growth in earnings. The team has consistently delivered on forecasts regarding operational performance.

Nowhere can we be more gratified at the manner in which we have met our challenges than in respect of the improved safety performance. We regret deeply the 14 deaths which occurred in accidents at our operations around the world. Yet we are pleased with the significant improvement over the 34 deaths in 2007, and hope that this trend will continue. I would like to pay tribute to Mark Cutifani and all the company's employees for their collective dedication that achieved this improvement.

HIGHLIGHTS 1998 – 2008

Annual Report 2008

– 7 –

The company took a major step to improve its exposure to the strong gold price following the \$1.7 billion rights offer in July. This capital raising allowed the company to make significant inroads into its hedge book. During 2008 the number of committed ounces was reduced by 47% from 11.28 million ounces to 5.99 million ounces. Assuming a prevailing gold price of \$900 per ounce it is expected that the average realised price in 2009 will be at a discount to spot of approximately 6%.

A further major financial event of 2008 for AngloGold Ashanti was the signing of a \$1 billion Syndicated Term Loan Facility Agreement (term facility) with Standard Chartered Bank to refinance our convertible bond, which was redeemed in February 2009. We were extremely pleased to have secured the refinancing during a time of almost unprecedented market uncertainty and scarcity of liquidity, and are grateful to Standard Chartered for this commitment to the company.

On the exploration front, we were pleased to announce during the year one of the most significant new gold discoveries of the current era, at La Colosa in Colombia, which enabled us to add 12.9 million ounces of gold to our resources base.

The company took a number of steps to restructure its asset portfolio in order to add value. In May, AngloGold Ashanti completed the transaction with B2Gold Corp in terms of which B2Gold acquired from AngloGold Ashanti additional interests in certain mineral properties in Colombia and, in exchange, AngloGold Ashanti acquired an interest of 15.9% in the issued share capital of that company. In July, AngloGold Ashanti finalised the transaction in terms of which it acquired 100% of the Golden Cycle Gold Corporation, which owned a 33.33% stake in the company's Cripple Creek & Victor mine (CC&V), now wholly owned. And in December we completed the purchase of São Bento Gold Company Limited and its wholly-owned subsidiary, São Bento Mineração S.A. from Eldorado Gold Corporation.

Finally, after year-end, the company's one-third share of Boddington mine was sold to majority owner Newmont for a total consideration of up to approximately \$1.1 billion and an agreement reached with Simmer & Jack for the sale of AngloGold Ashanti's Tau Leko mine and adjacent project areas. These transactions will strengthen the balance sheet and position the company well for further growth.

Mrs Elisabeth Bradley retired from the board of AngloGold Ashanti at the annual general meeting of shareholders held on Tuesday, 6 May 2008. She served on the board with distinction since the formation of AngloGold in 1998, and we express our deep gratitude for her years of service. Mr Simon Thompson resigned from the board with effect from 28 July 2008, having served since 2004. His profound insights will be missed, and we wish him well for the future.

2008 also marked the tenth anniversary of AngloGold Ashanti's formation. The group has come a long way in its first decade, and stands poised for a new era of growth, as it seeks vigorously to exploit its pipeline of projects and to manage the undoubted challenges it faces. We now have a very high-quality management team under new leadership, and I am confident at the prospect of launching AngloGold Ashanti successfully into its

ANGLOGOLD ASHANTI – A LEADING GLOBAL PRODUCER OF GOLD

Headquartered in Johannesburg, South Africa, the company has 21 operations and a number of exploration programmes in both the established and new gold-producing regions of the world.

In 2008, AngloGold Ashanti produced 4.98 million ounces of gold from its operations – an estimated 7% of global production – making it the third largest producer in the world. The bulk of its production came from deep-level underground operations (40%) and surface operations (2%) in South Africa. Contributions from other countries were Ghana (11%), Mali (8%), Australia (9%), Brazil (8%), Tanzania (6%), USA (5%), Guinea (7%), Argentina (3%) and Namibia (1%). In South Africa, ramping up of production at Moab Khotsong continued and is expected to increase significantly in 2009, and achieve full production levels in 2012.

During 2008, AngloGold Ashanti's global exploration programme continued to gain momentum, either directly or in collaboration with exploration partnerships and joint ventures, in Colombia, the Democratic Republic of Congo (DRC), Australia, Russia, China and the Philippines.

As at 31 December 2008, AngloGold Ashanti employed 62,895 people, including contractors, had proved and probable Ore Reserves of 74.9 million ounces of gold and had incurred capital expenditure of \$1,201 million for the year.

In response to an ever-changing socio-economic environment, AngloGold Ashanti announced its intention to review its current structure and asset base. It remains a values-driven company and these values, the foremost of which is safety, and the group's business principles continue to guide the company, its managers and employees, and form the basis of the company's contract with all of its business – shareholders, employees, communities, business partners, governments and civil society organisations.

STOCK EXCHANGE INFORMATION

AngloGold Ashanti's primary stock exchange listing is on the JSE Limited (Johannesburg). It is also listed on the exchanges in New York, London, Australia and Ghana as well as on Euronext Paris and Euronext Brussels. AngloGold Ashanti had 353,483,410 ordinary shares in issue and a market capitalisation of \$9.8 billion as at 31 December 2008 (31 December 2007: \$11.9 billion).

AngloGold Ashanti has eight gold mining operations in Africa (excluding South Africa) – two in Ghana, one in Guinea, three in Mali, one in Namibia and one in Tanzania. Combined, these operations employed around 16,000 people (including contractors) and produced a total of 1.6 million attributable ounces of gold, equivalent to 33% of group output. Ore Reserves at these operations amounted to 23.0 million ounces at year-end.

Africa (excluding South Africa)

AngloGold Ashanti has one operating gold mine, CC&V, in the United States which employed approximately 400 people (including contractors) and produced 258,000 ounces, equivalent to 5% of group output. Ore Reserves amounted to 4.9 million ounces at year-end.

North America

AngloGold Ashanti has one operating gold mine in Australia being Sunrise Dam. Approximately 1,200 people (including contractors) were employed in Australia at year-end and 433,000 ounces of gold, equivalent to 9% of group output, were produced. Ore Reserves amounted to 8.6 million ounces at year-end.

Australia

AngloGold Ashanti has three gold mining operations in South America – two in Brazil and one in Argentina – which combined employed around 5,200 people (including contractors) and produced a total of 561,000 attributable ounces, equivalent to 11% of group output. Total Ore Reserves at these operations amounted to 4.8 million ounces at year-end.

Performance

review 2008 – key data by region

Annual Report 2008

– 10 –

- Fatality rate declined by 57%, while a 20% reduction is achieved on reportable accidents.

- New company vision, mission and values developed.

- Continued restructuring to focus on new company strategy.

- Hedge buy-backs result in reduced hedge commitments, down by 47% to 5.99 million ounces.

- Successful conclusion of rights offer and refinancing to settle the convertible bond.

- Mineral Resources after depletion increased 16% or 33.4 million ounces to 241.0 million ounces, while Ore Reserves after depletion increased 2% to 74.9 million ounces (prior to Boddington sale).

- Final dividend declared of 50 South African cents per share (approximately 5 US cents per share), to give a total dividend for the year of 100 South African cents (approximately 11 US cents per share).

The seven deep-level AngloGold Ashanti operations and one surface operation in South Africa employed around 37,000 people (including contractors) and produced 2.1 million ounces of gold, equivalent to 42% of group production. At year-end, South African Ore Reserves

totalled 33.7 million ounces.

Annual Report 2008

– 12 –

1. FINDING THE OREBODY

AngloGold Ashanti's greenfields exploration group identifies prospective gold deposit targets and undertakes exploration on its own or in conjunction with joint venture partners. Worthwhile discoveries undergo a well structured and intensive evaluation process before a decision is made to proceed with developing the mine.

2. CREATING ACCESS TO THE OREBODY

There are two types of mining which take place to access the orebody:

-

Underground mining: a vertical or decline shaft is sunk deep into the ground to transport people and mining materials to underground levels from which the orebody is accessed through horizontal tunnels known as haulages and cross-cuts. Further on-reef development is then undertaken to open up the orebody so that mining can take place.

-

Open-pit mining: in this situation the ore lies close to surface and can be exposed for mining by "stripping" the overlying barren material.

3. REMOVING THE ORE BY MINING THE OREBODY

-

In underground mining, holes are drilled into the orebody, filled with explosives and then blasted. The blasted 'stopes' or 'faces' are then cleaned and the ore released is then ready to be transported to surface.

-

In open-pit mining, drilling and blasting may also be necessary to break the ore; excavators then load the material onto the ore transport system which is predominantly haul trucks.

AngloGold Ashanti's core business is the production of gold by exploring for, and mining and processing gold orebodies.

THE PROCESS OF PRODUCING GOLD

The process of producing gold can be divided into six main activities:

- Finding the orebody;
- Creating access to the orebody;
- Mining (breaking) the orebody;
- Transporting the broken material from the mining face to the plants for processing;
- Processing; and
- Refining.

This process applies to both underground and surface operations.

1
2
3

Annual Report 2008

– 13 –

4. TRANSPORTING THE BROKEN MATERIAL FROM THE MINING FACE TO THE PLANTS FOR TREATMENT

- Underground ore is brought to the surface by a combination of horizontal and vertical transport systems. Once on surface the ore is usually transported to the processing facilities by surface rail or overland conveyors.

- In open pit operations the haul trucks deliver the ore directly to the processing facilities.

5. PROCESSING

Comminution is the first step in processing and involves the breaking up of the ore, which is delivered as large rocks, into small particles so that the contained gold minerals are exposed and available for recovery. This is usually undertaken by a combination of multi-stage crushing and milling circuits with associated screening and classification processes to ensure that material at the correct size is removed promptly from the comminution circuit. Recovery of gold can then commence, depending on the nature of the gold contained in the ore. There are two basic classes of ore:

- free-milling, where the gold is readily available for recovery by the cyanide leaching process.

- refractory ores, where the gold is not readily available for leaching because it is locked within a sulphide mineral matrix (e.g. pyrite), extremely finely dispersed within the host rock (and hence not yet exposed) or alloyed with other elements which retard or prevent leaching (e.g. tellurides). Free milling and oxidised refractory ores are processed for gold recovery by leaching the ore in agitated (stirred)

tanks in an alkaline cyanide leach solution. This is generally followed by adsorption of the gold cyanide complex onto activated carbon-in-pulp (CIP). Refractory ores undergo pre-treatment to make them more amenable to cyanide leaching. This commonly takes the form of separating the gold bearing sulphide materials from the barren gangue material by using flotation to produce a high-grade sulphide concentrate. The sulphide concentrate is then oxidised by either roasting as at AngloGold Ashanti Brasil Mineração or bacterial oxidation (BIOX) as at Obuasi. This oxidation destroys the sulphide matrix and exposes the gold particles thereby making them amenable to recovery by the cyanidation process. An alternative process is the heap-leach process. This process is generally considered applicable to high-tonnage, low-grade ore deposits, but it can be successfully applied to medium-grade deposits where smaller ore deposit tonnages cannot economically justify constructing a capital intensive process plant. In this process, ore is crushed and heaped on an impervious or lined leach pad. Low strength alkaline cyanide solution is irrigated over the heaped pad for up to three months. The dissolved gold bearing solution is collected from the base of the heap and transferred to carbon-in-solution (CIS) columns where the gold cyanide complex is adsorbed onto activated carbon. The barren solution is refreshed and recycled to the top of the heaps. Gold which has loaded (adsorbed) onto activated carbon is recovered by a process of re-dissolving the gold from the activated carbon (elution), followed by precipitation in electro-winning cells and subsequent smelting of the precipitate into doré bars that are then shipped to gold refineries for further processing. At some AngloGold Ashanti operations, valuable by-products are generated

at the same time as the gold recovery process. These by-products are:

- silver, which is associated with the gold at some of our operations.
- sulphuric acid which is produced from the gases generated by the sulphide roasting acid plants; and

- uranium which is recovered in a process which involves sulphuric acid leaching followed by recovery of the leached uranium onto resin and subsequent stripping of the resin by ammonium hydroxide and precipitation of uranium oxide as “yellow cake”.

The residue from the process operations are stored in designated tailings storage facilities.

6. REFINING

The doré bars are transported to a precious metal refinery for further processing. In this process gold is upgraded to a purity of 99.5% or greater for sale to a range of final users. High purity gold is referred to as “good delivery” which means that it meets the quality standards set by the London Bullion Markets Association and gives the final buyer assurance that the bar contains the quantity and purity of gold as stamped on the bar.

– 14 –

Review of the year

Annual Report 2008

- 15 -

The year 2008, my first full year in office as CEO of AngloGold Ashanti, has been both eventful and fulfilling. While we have had a number of challenges to deal with, we have made consistent and positive progress as we create the new AngloGold Ashanti. As we ushered in 2008 in South Africa, we had to cope with the national power crisis. On a broader basis, as we made good progress in turning around some difficult assets, delivering on our production and cost promises quarter-on-quarter, the world was slipping into what we now term the “global financial crisis”. As a consequence, the gold price firmed during the course of the year, further improving our underlying profit performance and longer term outlook for the business. While these events were unfolding, we took the opportunity to reduce our gold price hedge commitments and rebuilt our financial capacity by reducing debt within the business. At the same time we made great progress in turning our safety performance around – reducing fatality rates and injury frequency rates across all areas in the business. By the end of 2008, we had reshaped the business – we have demonstrated that we can mine without fatalities being a necessary consequence of our activities. In this one step we have demonstrated our commitment to our values and the notion that “People are the Business...Our Business is People”. Our hedge book and balance sheet have been reshaped to support enhanced performance and as we head into 2009 know we have the team that can take us forward to achieve our vision to be “the leading mining company”.

SAFETY

On 8 November 2007 we declared that safety is AngloGold Ashanti’s first value, and we have lived that value through 2008. As a company and as leaders, we have a moral duty to do all we can to ensure that those who arrive at work return home safely and in better shape for having been an AngloGold Ashanti employee. While we made great

HIGHLIGHTS 1998 – 2008

progress in 2008 in reducing fatality rates by 57% year-on-year, we understand we still have a long way to go. It is with great regret that I report the loss of 14 colleagues through industrial accidents. The AngloGold Ashanti board extends its deepest sympathies to the families, friends and colleagues of those we have lost.

On the positive side, we are naturally gratified at the step-change improvement in our safety record, with the reduction in fatality rates supported by a 20% decline in our all-accident frequency rates. Both improvements are evidence of real change within the business – a stepping stone to achieving a workplace free of accidents and industrial disease. Our vision of “no harm” in our workplace has its foundations in our four-part strategy where we focus on safety so that it is emphasised to every employee, every day, and that this perspective shapes every conversation we have and every decision we make. We are learning to be vigilant in recognising hazards and taking the time to understand what it takes to reduce the risk to a level that can be managed. A central feature of this is the campaign to ensure that everyone understands that it is standard practice to stop work if they believe an area is unsafe. We are putting in place and managing to a set of systems that bind and link our activities to ensure safe outcomes. As leaders, every step and decision we take must be consistent with our safety message. Not only must we talk to change; we must also be the change.

REVIEW OF THE YEAR

We are pleased to be able to report that we have delivered on our production and cost commitments. Gold production in 2008 of 4.98 million ounces was at the upper end of market guidance provided at the beginning of the year, with cash costs of \$444/oz also within market guidance.

While we saw a number of positive achievements, our single disappointment has been the inconsistent performance at Geita in Tanzania. Our work to execute a production turnaround was progressing well through the second and third quarters before we experienced two significant breakdowns within the processing operations. We will continue to work the problems through a range of ongoing interventions, and we remain committed to delivering a strategy and outcome that will enhance shareholder value by the end of 2009.

On a more positive note, we have seen two consecutive quarterly improvements in production at our other most challenging operation, Obuasi in Ghana. The appointment of a new leader of our Ghanaian operations and an increased focus on the Obuasi turnaround are intended to enhance this turnaround as we head into 2009.

We have also delivered improvements in South Africa, Guinea, Argentina and Brazil.

The power crisis in South Africa, which began in January 2008, significantly affected the mining industry. When the national power utility, Eskom, gave notice of an immediate shortage of supply, the mining industry was forced to close operations on 25 January. The restart of the operations was a difficult process as the deep mines of South Africa cannot be turned on and off without careful time-weighted planning and execution.

Annual Report 2008

– 17 –

2006

Several new exploration ventures entered into

2007

Iduapriem and Teberebie become fully owned operations

The way in which the situation was initially managed by Eskom and the government was very disappointing. However, rather than succumbing to alarm and panic, the South African management team dealt with a difficult situation, prioritising engagement with government and Eskom, through our own offices and through the Chamber of Mines and Business Unity South Africa. Ultimately, the team used the crisis as a catalyst to review its energy efficiency performance, to explore new initiatives to decrease its electricity usage, and to speed up implementation of efficiency programmes.

Thanks to the pre-emptive work done, and thanks to the speed with which the government and Eskom adapted to the situation, we managed by May to sign up for 96.5% of our pre-January power supply, up from the 90% reinstated after the immediate four-day January crisis. Post the event, due to the initial energy efficiency measures we had put in place, we did not require the full allocation, and by the end of 2008 we were producing at full capacity on less than 94% of our 2007 power requirements.

South Africa's power supply issues are not fully resolved, and most likely will not be for some years, pending Eskom's capacity building programme scheduled to take place in the next five years. However, we are confident that government and Eskom, recognising the centrality of the business sector and the mining industry in particular, to economic development, will ensure that any future disruptions will be minimised.

A NEW OPERATIONAL DELIVERY INITIATIVE

After visiting our operations, it is clear that we have many opportunities to enhance and improve our core operations performance. It is also clear that one reason for the lack of consistency is that we require a common and systematic approach to many of our activities, both in terms of operational systems and in terms of the management of people. So, in addition to the shorter-term turnaround plans we have been working on at Obuasi and Geita, we have launched a systematic programme designed to address these weaknesses – a business improvement programme to be rolled out to every operation over the next three years.

The plan is designed to achieve specific targets in the areas of safety, productivity, environmental incidents, production, costs and return on capital invested.

The plan is designed to achieve a range of specific five-year targets:

- a reduction in accident rates;
- an improvement in productivity;
- a reduction in reportable environmental incidents;
- an increase in production to 6.0 million ounces;
- a reduction in real unit costs; and
- an increase in the return on investment to above 15%.

We will be monitoring progress on the execution of the plan and reporting back to you each year.

OPERATIONAL AND FINANCIAL RESTRUCTURING

The key to achieving these performance improvement objectives is the company's people. "People are the Business... Our Business is People" is not a mere slogan. It goes to the heart of what we at AngloGold Ashanti do. We have continued to consolidate the company's executive restructuring we began in 2007, focusing on flattening the operational hierarchy, decentralising operational control metrics to the operations where they belong, and ensuring clearer lines of accountability for delivering on our commitments.

At the same time the finance team has delivered some outstanding results during the year – reducing our hedge book by more than 47% and reducing debt by 30%.

As a consequence of the continuing improvements in operations, renewed focus on capital management and the financial restructuring, AngloGold Ashanti is positioned to improve its free cash flow from operations by more than \$1.1 billion in 2009. While increasing gold prices have contributed to this forecast outcome, the internal restructuring of operations, the hedge book and our debt have contributed more than 70% to this remarkable outcome.

Having largely achieved these goals at executive level, similar initiatives will be rolled out to the company's business units in the period ahead.

I would like to thank our executive team, and all members of the AngloGold Ashanti global team, for the tremendous contributions they have made to our achievements this year.

MISSION, VISION AND VALUES

In all we do to enhance value at AngloGold Ashanti, our activities are based on the principle that we will carry out our activities in a way that demonstrates due respect for our employees, the societies and communities in which we operate, and the physical environment. You may read our new mission, vision and values, and about the process we have undergone to develop them, in the Report to Society. We ask that our performance be judged, not only by the return on investment to our shareholders, but also by how we deliver these results as our values reflect our commitment to delivering sustainable outcomes.

ENHANCED EXPOSURE TO THE GOLD MARKET

In my first annual review a year ago, I spoke about the impact on our revenues of the company's significant gold hedge book and our determination to reduce these commitments to manageable levels. The successful completion in July of a rights offer that raised \$1.7 billion enabled us to deliver on our first phase objectives. We initially capitalised on a weaker gold market from the second quarter of the year in order to execute a combination of delivery into and early settlement of non-hedge derivative contracts. The number of committed

Annual Report 2008

– 19 –

2008

Resource estimate for La Colosa deposit in Colombia confirmed

2008

Acquisition of interests in B2Gold, Golden Cycle and São Bento Gold

ounces was reduced by 4.4 million ounces (39%) from a total of 11.28 million ounces as at 1 January 2008 to 6.9 million ounces as at 1 July 2008. During the second half of the year, AngloGold Ashanti continued to settle by physical delivery, outstanding contracts to effect a reduction of approximately 47% of committed ounces in total over the course of the year.

It is expected that the average realised price received will be at or around a discount of approximately 6% in 2009, assuming an average prevailing spot gold price of approximately \$900 per ounce. This represents a significant improvement on the position prior to the restructuring.

PURSUIING GROWTH

There was a pleasing increase in resources and reserves during 2008, indicating the success of our exploration programme and some strategic transactions. Mineral Resources increased by 16% to almost 241.0 million ounces (after depletion). This includes an addition of 12.3 million ounces delineated by greenfields activity at La Colosa in Colombia.

The finalisation of transactions at B2Gold in Colombia, the acquisition of 100% of the Golden Cycle Gold Corporation, which owned a 33.33% stake in the company's Cripple Creek & Victor mine, and the purchase of São Bento Gold Company Limited and its wholly-owned subsidiary, São Bento Mineração S.A. from Eldorado Gold Corporation, were also designed to add value and growth. The former offers enhanced opportunities in our Colombian exploration programme, while the latter two provide fuller participation in production and enhanced reserves and resources at or near existing operations.

Organic growth can still be expected from existing assets. The key to unlocking growth here is to improve productivity, efficiencies and to mine deeper. The group is not averse to further acquisitions, in South Africa and elsewhere, should these propositions add value.

Annual Report 2008

– 20 –

Rand Refinery, South Africa

CEO's

review *cont.*

PROSPECTS

In 2009, the company is expecting to produce between 4.9 million ounces and 5.0 million ounces of gold at total cash costs ranging from \$435/oz to \$450/oz. As a result of the hedge restructuring completed in 2008 and assuming a spot gold price of approximately \$900/oz in 2009, we expect an average price received of \$846/oz, which represents a 6% discount to the spot price. This would result in the cash generated at our operations increasing by some \$1.1 billion this year.

Any gold price upside above \$900/oz will obviously provide greater cash flow and earnings leverage and, in the event we continue to see gold price volatility with potential downside pressure, we retain a robust business model with sound cost control and capital management flexibility.

CONCLUSION

The global economy is facing unprecedented challenges in the foreseeable future. AngloGold Ashanti is a global corporate citizen and will not be immune to these challenges. We remain focussed on gold, possibly the resource least affected by these events. Our challenge is to position the company so that we are able to turn these difficulties and challenges into opportunities. The opportunities we see will support our business improvement objectives and the potential for growth as we seek to develop towards our vision of being the leading mining company. We have a highly motivated and skilled team, we each understand what we have to do and for what we are accountable.

In our own words... People are the Business... Our Business is People.

Mark Cutifani

Chief Executive Officer

6 March 2009

Annual Report 2008

- 21 -

Iduapriem, Ghana

OVERVIEW

The three key financial challenges that faced AngloGold Ashanti during 2008 were:

-

Maximising margins by both reducing the hedge book commitments and implementing effective cost controls in an extremely volatile economic environment, which saw significant commodity price and currency swings;

-

In a market that was squeezed for credit and liquidity, redeeming the R2.0 billion South African corporate bond and implementing a refinancing plan to be able to redeem, upon maturity in February 2009, the \$1.0 billion convertible bond; and

-

Delivering sales of non-strategic assets of \$1.0 billion to create balance sheet flexibility for years 2009 and 2010. The company successfully met all three challenges. During 2008 the hedge book commitments were reduced by 47% from 11.28 million ounces to 5.99 million ounces, following an oversubscribed rights offering in July 2008 for \$1.7 billion. Total cash operating costs were tightly controlled during a year which saw sharp increases in inflation, power and fuel costs. This enabled AngloGold Ashanti to finish the year at \$444 per ounce which is competitive within the gold mining industry. During August 2008, the company redeemed in full, upon maturity, the R2.0 billion South African corporate bond and in November 2008 obtained a \$1.0 billion term facility from Standard Chartered Bank to place it in a position to February 2009. In January 2009, the company announced the sale of its one-third interest in the Boddington project for an aggregate consideration of up to approximately \$1.1 billion. The above factors should provide AngloGold Ashanti with better gold price leverage and balance sheet flexibility going forward.

RESULTS FOR THE YEAR

-

Average dollar gold spot price of \$872 per ounce, 25% higher than in 2007.

-

The 2008 average received gold price decreased by 23% to \$485 per ounce due to the effects of hedge restructuring. The average received price, excluding the effects of the hedge restructure, increased by 12% to \$702 per ounce.

-

Gold production from continuing operations declined from 5.48 million ounces in 2007 to 4.98 million ounces in 2008.

CFO's
report

Annual Report 2008

– 22 –

repay the \$1.0 billion convertible bond when it matured in

- Total cash costs increased by 24% to \$444 per ounce, largely owing to the impact of inflation, higher fuel and power costs, lower grades mined during the year, partially mitigated by the weakening of some of the local currencies during the latter part of the year.
- Adjusted headline earnings decreased to a loss of \$897 million from \$278 million in 2007 primarily due to the hedge reduction.
- A final dividend of 50 South African cents per share or approximately 5 US cents per share was declared, resulting in a total dividend for 2008 of 100 South African cents or approximately 11 US cents per share.
- Successful capital raising of some \$1.7 billion in July 2008 provided the necessary liquidity to restructure the hedge position.
- Term facility of \$1.0 billion obtained to redeem the \$1.0 billion convertible bond.

EXCHANGE RATES

The main currency impact on costs reported in US dollars relative to the countries in which AngloGold Ashanti operates, arose from a 17% weaker rand and a 6% stronger Brazilian real against the US dollar.

The average exchange rate for the year ended 31 December 2008 was R8.25:\$1 compared with R7.03:\$1 in 2007. The average value of the Australian dollar versus the US dollar for 2008 was A\$1:\$0.85 compared with A\$1:\$0.84 in 2007. The average value of the Brazilian real versus the US dollar for 2008 was BRL1.84:\$1 compared with BRL1.95:\$1 in 2007.

PRODUCTION

In 2008 gold production approximated 4.98 million ounces compared to 5.48 million ounces in 2007. This was in line with the forecast range of between 4.8 to 5.0 million ounces for the year. This decline in production was largely as a result of reduced volumes mined at the South African operations owing to lower grades, safety related stoppages especially related to increased seismicity, and the interruption to the power supply during the first quarter. Argentina was impacted by poor grades and intermittent plant break downs; Tanzania production was impacted by plant unavailability and delays in accessing the higher grades. The reduction in Australia was Mponeng and Moab Khotsong in South Africa, where the ramp up in production continued.

INCOME STATEMENT

The most significant income statement event of 2008 was the reduction of the hedge book. During the year the hedge book was reduced by 5.29 million ounces from 11.28 million ounces at the beginning of the year to 5.99 million ounces as a result of the physical settlement of maturing contracts and buy-back of non-hedge derivative contracts. These transactions, which were funded from the proceeds of a rights offer completed in July 2008, have enabled the company to significantly restructure and reduce its existing gold hedging position, which has adversely affected its financial performance in recent years. The company had traditionally used gold hedging instruments to protect the selling price of some sales against declines in the market price of gold and the use of these instruments have prevented the company from fully participating in the significant increases in the market price of gold in recent years.

Also during the year, the group changed its policy regarding the accounting of incorporated joint ventures from the proportionate consolidation method to the equity accounting method. Due to the nature of the group's Annual Report 2008

– 23 –

jointly controlled entities, the presentation in the income statement is more relevant and represents international trends in accounting. Accordingly all comparative data has been restated. in line with plan as the high-grade pit was depleted. Record production was reported at Siguiri in Guinea, and

Gold income

The average gold spot price of \$872 per ounce for the year was 25% higher than that in 2007. However, the received gold price decreased by \$144 per ounce or 23% to \$485 per ounce, primarily as a result of the close out of the hedging transactions effected in the middle of the year. Towards year-end, the price received was at a 13.5% discount to the average spot price as the remaining planned hedge reductions were effected.

Gold income increased by 21%, rising from \$3,002 million in 2007 to \$3,619 million in 2008. This increase was primarily a result of the improved price of gold received (excluding the accelerated settlements of non-hedge derivatives), although this was offset to a certain extent by reduced production.

Cost of sales

Cost of sales increased by 11% from \$2,458 million in 2007 to \$2,728 million in 2008. This was largely attributable to a mix of currency and inflationary effects, resulting from increased mining contractor costs and higher diesel, fuel, transport and electricity prices. This was partially offset by the effects of cost-saving initiatives and the weakening of some local currencies during the latter part of the year.

Cost of sales changes can be analysed as follows:

- Total cash costs increased to \$2,113 million in 2008 from \$1,836 million in 2007, equating to an increase in total cash costs per ounce from \$357 in 2007 to \$444 in 2008. This was marginally outside the forecast of \$425 – \$435 per ounce primarily due to higher inflationary trends and higher power and fuel costs.

Of the \$87 per ounce increase, \$53 per ounce is attributable to inflation, \$25 per ounce to lower grades, \$20 per ounce to volumes and a net \$11 per ounce for other variances; partially offset by exchange gains of \$22 per ounce.

- Retrenchment costs were \$9 million in 2008 compared with \$19 million in 2007. Costs incurred in 2008 and 2007 were as a result of a general cost-efficiency drive and staff reductions at mines in Africa.

- Rehabilitation and other non-cash costs decreased by \$33 million compared with the previous year resulting in a charge of \$28 million compared to a charge of \$61 million, largely because of changes to estimates, the effect of interest rates in discounting and a reassessment of the processes to be undertaken to complete the group's restoration obligations.

- The amortisation of tangible assets at \$560 million was \$7 million lower than in 2007. This minor reduction is largely attributable to the reassessment of the useful lives of our mining assets in accordance with revisions to the business plans made at the beginning of the year, and due to lower production.

Loss on non-hedge derivatives and other commodity contracts was \$297 million in 2008 compared to a loss of \$792 million the previous year. This loss was primarily a result of the revaluation of non-hedge derivatives resulting from changes in the prevailing spot gold price, exchange rates, interest rates and volatilities compared with the previous year as well as the loss incurred in normal purchases normal sales with a counterparty of \$188 million. During the year, the spot price of gold increased from \$836 per ounce at 1 January, 2008 to \$872 per ounce at year-end. Refer to pages 82 – 86 for a review of the gold market during 2008.

Corporate and other administration expenses increased by \$3 million to \$131 million in 2008, which is significantly less than the normal rate of inflation and is mainly due to the weaker rand against the US dollar. Market development costs amounted to \$13 million, most of which was spent through the World Gold Council.

Annual Report 2008

– 24 –

CFO's

report *cont.*

Exploration continued around the operations in the countries in which the group operates, namely, Australia, Ghana, Guinea, Tanzania, Mali, Namibia, South Africa and the USA. In addition, exploration activities continued to focus on new prospects in the Democratic Republic of Congo, Colombia, China, Philippines, Russia and Australia. Total exploration expensed (excluding equity accounted joint ventures) during 2008 was \$126 million of which \$94 million was for greenfields exploration. The increase in exploration costs expensed of \$9 million on the previous year was primarily a result of increased expenditure at greenfields sites in Colombia and Australia. For further information on exploration activities refer to pages 87 – 95.

Other operating expenses included post-retirement medical provisions for operations mainly in South Africa of \$2 million, and other employment costs of \$4 million.

The group incurred an operating special items loss of \$1,538 million which arose mainly from an impairment charge \$1,608 million. These related primarily to the former Ashanti mines in Ghana and Tanzania. At the time of the Ashanti acquisition, the mines were accounted for by AngloGold Ashanti based on the forward gold curve. Since then, AngloGold Ashanti has consistently applied this methodology i.e. the forward gold curve of a 30-day average spot price during the fourth quarter, to test these assets annually for impairment purposes. However during 2008, although the spot price was higher than the previous year, given the drop in US interest rates, the forward curve was both lower and less steep during the fourth quarter. This has an adverse impact of some \$75-100 per ounce at these long life mines which is material. In addition, the discount rates applied in 2008 are higher than those used in the previous year, reflecting current market and economic conditions. The above two factors i.e. the forward gold curve and discount rates, have been the primary cause of the accounting write down.

There were sundry other items including a reassessment of indirect tax recoverables at the Africa mines, provisions for royalty disputes partially offset by profits on the disposal of and recoveries from various assets.

OPERATING LOSS

The group reported an operating loss in 2008 of \$1,220 million compared with an operating loss of \$542 million in 2007, largely as a result of the effects of asset impairments.

Annual Report 2008

– 25 –

Cerro Vanguardia, Argentina

LOSS ATTRIBUTABLE TO EQUITY SHAREHOLDERS

The loss attributable to equity shareholders was further impacted by the following:

- Interest received increased by \$23 million to \$66 million, mainly as a result of increased funds arising from the higher average gold price; and

- Finance costs approximated those of 2007 mostly as a result of reduced borrowings in a rising interest rate environment for variable overdrafts and bank loans, and the fixed interest rate on the convertible bond.

The taxation charge reduced from a charge of \$101 million in 2007 to a benefit of \$197 million in 2008. This was partially due to lower earnings, lower taxation rates in South Africa, and the deferred tax benefit arising from early hedge settlements.

BALANCE SHEET

During 2008, the following events had a significant impact on the balance sheet:

- AngloGold Ashanti's 33.3% interest in Boddington Joint Venture was reclassified to assets and liabilities held for sale. The total amount of assets reallocated amounted to \$792 million and liabilities \$48 million;

- Impairment charges aggregating \$1,608 million mainly in relation to the former Ashanti assets. This adjustment is based on assumptions relating to market conditions which include the lower gold forward curve, higher discount rates, higher power tariffs in Ghana and reduced reserves at Geita. Tangible asset impairments (net of reversals) amounted to \$1,493 million and goodwill impairments amounted to \$109 million;

- shareholders in respect of a rights offer which generated proceeds of some R13 billion (\$1.7 billion) which funds were applied primarily to reduce the hedge book. The company capitalised on a weaker gold market during the year to execute a combination of delivering into and early settling of non-hedge derivatives. During 2008, the total number of committed ounces reduced by 5.29 million and the hedge book reduced by 5.17 million ounces on a net delta basis. The restructuring resulted in the received gold price being around 23% lower and the adjusted headline earnings reducing by an amount after taxation of \$916 million which includes a charge for the uranium contracts of \$11 million. In addition, uranium contracts of 1.0 million pounds were cancelled during the year, which represents a reduction of 20% of uranium contracts outstanding at the beginning of the year. This positions the company to participate more extensively in the uranium spot market from 2009, which in turn will provide by-product revenue to the benefit of total cash costs.

- The \$1 billion convertible bond, due 27 February 2009, issued by AngloGold Ashanti Holdings plc has been reallocated from long-term borrowings to short-term debt;

- Effective 1 July 2008, AngloGold Ashanti acquired 100% of Golden Cycle Gold Corporation (GCGC) through a merger transaction in which the GCGCs shareholders received consideration consisting of 3,181,198 AngloGold Ashanti ADSs which represented an aggregate consideration of approximately \$109 million. GCGC, which was listed and traded on the NYSE ARCA Exchange, was a Colorado-based holding company with its primary investment being its joint venture interest in the Cripple Creek & Victor Gold Mining Company (CC&V) located in Colorado, United States.

- On 27 August 2008, AngloGold Ashanti settled all amounts due in respect of the company's R2 billion corporate bond;

- On 15 December 2008, AngloGold Ashanti purchased the São Bento Gold Company Limited, and its wholly owned subsidiary São Bento Mineração for a consideration of \$70 million through the issue of 2,701,660 ordinary shares.

The rights offer which closed on 7 July 2008, resulted in the issue of 69,470,442 ordinary shares to

CASH FLOW

Operating activities

Cash generated from operations of \$632 million was a combination of the loss before taxation of \$1,377 million as set out in the income statement, adjusted for movements in working capital and non-cash flow items. The most significant non-cash flow items were the impairments of tangible and intangible assets and investments of \$1,608 million and the amortisation of tangible assets of \$560 million.

Cash generated from operations was further increased by the dividends received from the equity accounted joint ventures of \$78 million, reduced by payments to early settle some hedge commitments and uranium contracts of \$1,113 million and normal taxes paid of \$125 million. Consequently, net cash outflow from operations was \$529 million in 2008 compared with an inflow of \$866 million in 2007.

Payments to suppliers increased by 46%, offset partly by the higher average price received (excluding settlements of non-hedge derivatives) for the year which in turn resulted in increased receipts from customers of 20%.

Investing activities

During 2008, capital expenditure totalled \$1,194 million. The capital spend was funded from operating cash flow, debt facilities and in part from the proceeds from a rights offer which raised some \$1.7 billion in July 2008. Total capital expenditure for 2008 was \$179 million more than in 2007, owing mainly to expenditure on the Boddington expansion project during the year.

Proceeds from the disposal of tangible assets include \$14 million from the disposal of certain North American royalty and production related interests of the El Chante and Marigold projects to Royal Gold, \$14 million from the disposal of a 50% interest in Amikan and AS APK to the Polymetal Joint Venture, and \$7 million from real estate activities in Brazil.

Proceeds from disposal of assets of discontinued operations of \$10 million relates to the sale of Ergo assets to a consortium of Mintails South Africa (Pty) Limited/DRD South African Operations (Pty) Limited.

Investments acquired and disposed of during 2008 relate mainly to investments held in rehabilitation trust funds established by AngloGold Ashanti in compliance with regulatory requirements.

Annual Report 2008

– 27 –

Sunrise Dame, Australia

The proceeds from the disposal of associates includes the net proceeds of \$48 million arising from the sale of the 50% interest in Nufcor International Limited to the Constellation Energy Commodities Group. Interest received increased by \$32 million when compared with 2007, as a result of higher cash levels resulting mainly from the rights offer in July 2008.

Financing activities

During July 2008, an amount of \$1.7 billion was raised by way of a rights offer at a ratio of 24.6403 rights offer shares for every 100 AngloGold Ashanti shares held on the record date of 6 July 2008. The rights offer resulted in the issuance of 69,470,442 new ordinary shares of 25 SA cents each to ordinary shareholders at a subscription price of R194.00 per share. The transaction was highly successful, with a 98% take up from rights holders to acquire rights offer shares. Applications for additional rights shares representing nearly six times the number of rights offer shares were received.

Proceeds from borrowings amounted to \$853 million during 2008 and included a drawdown of \$743 million on the \$1,150 million syndicated loan facility. The 2007 year included a \$525 million drawdown on the same facility.

Repayments of borrowings amounted to \$614 million and included the repayment of the South African corporate bond of \$242 million, and \$316 million on the \$1,150 million syndicated loan facility. Other loan repayments include normal scheduled payments in terms of loan agreements.

Dividend payments totalling \$58 million were made during the year, compared with \$144 million in the prior year. \$186 million, which when combined with the opening balance of \$477 million, and a negative translation of \$88 million, resulted in a closing cash and cash equivalent balance of \$575 million.

OTHER DEVELOPMENTS

On 20 November 2008, AngloGold Ashanti successfully arranged a \$1 billion bridging facility which is available (at the company's discretion) until November 2010 to finance the redemption of the convertible bond that to obtain full value from the sale to Newmont of the one-third interest in the Boddington project which was announced on 27 January 2009 and the announced sale of the Tau Lekoa and the adjacent project areas made on 17 February 2009.

The consideration for the sale of Boddington, which is expected to close around the end of the first quarter of 2009, involves the following elements:

- an upfront cash consideration on closing of the sale of \$750 million;
- a deferred payment due at the end of 2009 of \$240 million, payable in cash or freely tradeable Newmont shares;
- full reimbursement upon closing of all cash calls for the project funded by AngloGold Ashanti during 2009;
- royalty payments of up to \$100 million from mid 2010, subject to the project achieving a cash cost margin in excess of \$600 per ounce; and
- a payment from AngloGold Ashanti to Newmont of \$8 million upon closing, being its share of working capital at 31 December 2008.

In addition to saving on a budgeted capital spend of A\$269m during 2009, the proceeds from the sale to be received this year (net of capital gains tax) is expected to be approximately \$907 million (at an exchange rate of A\$/0.8054).

Annual Report 2008

– 28 –

CFO's

report *cont.*

The net result of AngloGold Ashanti's operating, investing and financing activities was a net cash inflow of matured on 27 February 2009. The removal of this refinancing risk placed the company in a stronger position

The Boddington sale together with the term facility, in addition to reducing the net debt significantly, will also provide the company with further financial flexibility to November 2010. It is important to note that as a result of these transactions, the company's refinancing need and related risk has been reduced. AngloGold Ashanti now has considerable flexibility to consider its long-term funding options to refinance the residual debt which is due to mature in late 2010.

OVERVIEW OF THE HEDGE BOOK

During 2008, the company reduced its hedge commitments by 47% from 11.28 million ounces to 5.99 million ounces. The hedge book net delta as at 31 December 2008 was 5.22 million ounces. The negative marked to market value of the hedge book as at 31 December 2008 (off a spot gold price of \$872 per ounce, exchange rates of R9.455/\$ and A\$/(\$0.6947) was \$2.5 billion (after the credit risk adjustment of all hedge transactions). The details of the hedge book are provided in note 37 on page 285.

expects to achieve a received price representing a discount of approximately 6% to the spot price during 2009, which represents a significant reduction to the position that existed prior to the hedge book reduction.

Following the sale of Boddington, the 2009 production is estimated at 4.9 million ounces to 5.0 million ounces.

(1)

This is based on the following assumptions: R9.75/\$, A\$/\$0.675, BRL2.25/\$ and Argentinian peso 3.65/\$; fuel at \$50 per barrel

and lower consumable costs relative to last year.

(2)

Capital expenditure for 2009 is estimated at approximately \$840 million (excluding amounts to be spent at Boddington). This is a

significant reduction of \$360 million or 30% on levels expended in 2008.

Capital expenditure is managed in line with earnings and cash flows and may fluctuate accordingly. Forecast capital expenditure

for operations with minorities is reported at 100%. For entities which are equity accounted, the forecast capital spend is the

attributable share.

(3)

In South Africa, production assumes stable power supply from Eskom.

Definitions

(1)

Stripping ratio = (total tonnes mined – ore tonnes mined)/ore tonnes mined.

(2)

Tonnes placed onto leach pad.

(3)

Recoverable gold placed onto leach pad inventory.

(4)

Recoverable gold placed/tonnes placed.

Comments

(5)

Average gold price received negatively impacted by the reduction of the hedge book in 2008.

(6)

Cost increases have been driven primarily by input cost inflation.

(7)

Capital expenditure has increased year-on-year in accordance with AngloGold Ashanti's growth strategy.

Safety

For AngloGold Ashanti, people come first and consequently the company places the highest priority on safe and healthy practices and systems of work. AngloGold Ashanti will continue to strive to improve its safety performance across its global asset base. The 'Safety is our first value' campaign initiated in November 2007 resulted in significant improvements to safety statistics throughout 2008.

In terms of lost-time injuries, the lost-time injury frequency rate (LTIFR) per million hours worked for the year was 7.32 as compared to 8.24 in 2007, an improvement of 11%. Regrettably in 2008, 14 AngloGold Ashanti employees lost their lives (2007: 34 fatalities) which translates into a fatal injury frequency rate (FIFR) for the group of 0.09 per million hours worked for the year (2007: 0.21 per million hours worked).

Operational review

In 2008, gold production totalled 4.98 million ounces compared to 5.5 million ounces in 2007. This decline in production was as a result of lower grades, safety related stoppages and the interruption to the power supply in South Africa and reduced production, as anticipated, at Sunrise Dam in Australia, at Cerro Vanguardia in Argentina as a result of a decline in feed grades associated with agitator problems in the leach tanks, and at Geita as a result of critical plant maintenance. Total group cash cost per ounce for the year was \$444 compared to \$357 in 2007.

Capital expenditure amounted to \$1,201 million (2007: \$1,059 million) of which 24% was stay-in-business expenditure and 22% expenditure on ore reserve development, principally at the South African operations.

The remaining 54% was expenditure on new project development.

Total project capital was just over \$650 million, of which almost \$420 million was at Boddington. The other main areas of project spend were the Mponeng VCR project (\$45 million), Iduapriem \$43 million (mainly the plant expansion), AngloGold Ashanti Brasil Mineração (\$24 million), TauTona \$21 million (mainly the below 120 level project) and Serra Grande \$20 million (the main project being the plant expansion).

Outlook

Gold production for 2009 is forecast to be between 4.9 million and 5.0 million ounces at a total cash cost in a range between \$435/oz and \$450/oz. This is based on the following exchange rate assumptions: R9.75/\$, A\$/0.68, Brazilian real 2.25/\$ and Argentinian peso 3.65/\$.

Capital expenditure of around \$840 million is scheduled, of which South Africa accounts for 36%, Ghana and Brazil each 18%, and the USA 9%.

AngloGold Ashanti's seven mining operations in South Africa are grouped into the West

Wits and Vaal River regions. These deep-level operations produced 2.1 million ounces in 2008, equivalent to 42% of group production.

Safety

At the South African operations the incidence of white flag days, that is a day on which no injuries occur, improved from two white flag days in 2007 to 40 white flag days for 2008. There were most regrettably 11 fatalities during 2008, 16 fewer than in 2007, which represents a 59% improvement. This resulted in a FIFR of 0.12 per million hours worked for the year, as opposed to 0.29 in 2007, which is equivalent to the Gold Mining Industry 2013 FIFR benchmark.

The LTIFR for the South African operations as a whole was 11.24 per million hours worked (2007: 12.72), indicating a significant improvement in safety performance. Other significant achievements included the first ever fatality free quarter (second quarter 2008), the longest fatality free period in history (110 days), the first time ever that four operations achieved 1 000 000 fatality free shifts within one calendar year and a period of eight consecutive fatality free months for the Vaal River operations.

The safety of AngloGold Ashanti's workforce is a priority and the roll-out of the 'Safety is our first value' continued at the South African operations. A framework on the management of safety, based on OSHAS 18001:2007 was developed. Safety campaigns at these operations are run in collaboration with the trade unions and government representatives. Simultaneously, various safety interventions were implemented to re-emphasise the company's principles and standards regarding safety. The focus is on leadership, behaviour and on improving compliance with operating standards at all levels. Key to this is ensuring that employees are competent to both perform their duties and responsibilities safely and to identify and manage hazards encountered in the workplace

Operating review

Gold production from the South African operations totalled 65,283 kilograms (2,099,000 ounces) in 2008, down 10% on the 72,429 kilograms (2,328,000 ounces) produced in 2007. The cause of this decline was

Review of operations

South Africa

Annual Report 2008

– 39 –

mainly as a result of the Eskom power outages early in the year and several safety-related stoppages during the course of the year.

Total cash costs at the South African operations rose by 23% to R95,144/kg (\$362/oz) from R77,372/kg (\$343/oz) in 2007, driven largely by annual wage increases, higher power tariffs and input cost inflation.

Total uranium production for the year was 4% higher than the prior year at 1.3 million pounds, despite the power-related production stoppages earlier in 2008. The settlement of some uranium contracts during the year resulted in greater exposure to spot uranium prices, thus reducing the loss incurred as compared with 2007.

Capital expenditure at the South African operations totalled R2,779 million (\$337 million) (2007: R2,535 million; \$361 million), 57% of total expenditure was for ore reserve development and the remainder mostly on projects such as Zaaiplaats, Mponeng VCR and TauTona below 120.

Susan Winkler

Geologist

Corporate Office, Johannesburg

“Without an undeterred focus on mining safety, the future of our company and the existence of gold mining are threatened.

It’s essential that we treat each other with dignity and respect, and appreciate the value of diversity in our company.”

Annual Report 2008

– 40 –

WEST WITS

The Mponeng, Savuka and TauTona mines are situated on the West Wits Line, near the town of Carletonville, straddling the border of Gauteng and North West Province. Mponeng has its own gold processing plant while the Savuka and TauTona operations share a plant.

Together, the West Wits operations collectively produced 30,498 kilograms (980,000 ounces) of gold, equivalent to 20% of group production.

MPONENG

Description

Mponeng is situated close to the town of Carletonville in North West Province, south-west of Johannesburg, straddling the border with the province of Gauteng, and currently mines the Ventersdorp Contact Reef (VCR) with stoping taking place at an average depth of 3,054 metres. The deepest operating stope is at a depth of 3,370 metres below surface. Given the high degree of variability in the grade of the VCR at Mponeng, a sequential grid mining method is used which allows for selective mining and increased flexibility in dealing with changes in grade ahead of the stope.

Mponeng comprises a twin-shaft system housing two vertical shafts and two service shafts. Ore mined is treated and smelted at Mponeng's gold plant. The ore is initially ground down by means of semi-autogenous milling after which a conventional gold leach process incorporating liquid oxygen injection is applied. The gold is then extracted by means of carbon-in-pulp technology. The Mponeng gold plant conducts electro-winning and smelting (induction furnaces) on products from Savuka and TauTona as well.

Safety

The mine was awarded OHSAS 18001:2007 certification during the year and achieved its second one million fatality-free shifts award on 18 June 2008. Safety at Mponeng improved during the year, with the LTIFR decreasing from 13.08 per million hours worked in 2007 to 11.44 in 2008. There were two fatalities during the year (2007: six) resulting in a decrease in FIFR to 0.14 per million hours worked (2007: 0.42).

Annual Report 2008

- 41 -

Operating review

Production rose 2% to 18,672 kilograms (600,000 ounces) in 2008 and the area mined increased marginally,

largely owing to an increase in face length. Various cost savings initiatives, resulted in costs contained to inflation. Total cash costs were 10% higher at R65,365/kg (\$249/oz) as a result of inflationary pressures on major input costs of power, labour, support and stores.

Capital expenditure (including the amounts spent on the below 120 VCR project) for the year totalled R707 million (\$86 million) (2007: R604 million; \$86 million).

Growth prospects

There are currently two growth projects under way at Mponeng.

VCR below 120 project: The project scope is to develop four declines from 120 level to the 126/127 levels to access the Ventersdorp Contact Reef. It includes the installation of the supporting infrastructure (refrigeration, backfill, equipping of the decline, etc) required to service a planned 10,000m

2

/month production plan.

Development is ahead of schedule and in line with budget, and in January 2009, became the deepest mine in the world. The project is anticipated to recover 2.7 million ounces of gold at a cost of R2.03 billion (\$0.2 billion). Construction began in 2007 with on reef development and the start of production scheduled for 2013 and full production due in 2015

CLR below 120 project: Feasibility work on this project which involves accessing the Carbon Leader Reef, about 900m below the VCR, is in progress. Initial estimates are that it has the potential to produce 10.6 million ounces at a cost of R12.7 billion (\$1.5 billion). The project is to be presented to the board for formal approval in July 2009 and, if approved, development will begin in August 2009 with production scheduled to start in 2022.

Outlook

Production at Mponeng is forecast to decline to approximately 17,000 kilograms (530,000 ounces) at a total cash cost ranging from \$260/oz to \$280/oz. Capital expenditure is scheduled to be R820 million (\$84 million) with R140 million (\$52 million) to be expended on the projects and the balance on ore reserve development and drilling.

Annual Report 2008

– 42 –

SAVUKA

Description

Savuka is situated on the West Wits line in the province of Gauteng, approximately 70 kilometres south-west of Johannesburg. Savuka is close to the town of Carletonville in North West Province. Savuka currently mines both the CLR and the VCR.

This mining operation comprises sub- and tertiary-shaft systems with the latter reaching a depth of 3,777 metres.

Ore mined at Savuka is processed firstly at the Savuka plant. The plant uses conventional milling to crush the ore and a carbon-in-pulp circuit to treat the ore further, after which it is sent to the Mponeng gold plant where the gold is extracted by means of electro-winning and smelting.

Safety

Savuka achieved OHSAS 18001:2007 certification during the year. There was an improvement in safety during the year with an overall LTIFR for the year of 15.20 per million hours worked compared to 25.99 in 2007.

Regrettably there was one fatality at the operation in 2008.

Operating review

Production was down to 2,057 kilograms (66,000 ounces) in 2008, more than had been planned. Volumes mined were 11% down on 2007 with tonnes milled down 4%. The effects on production of safety and power-related stoppages countered the positive effect of improved drilling, blasting and mining mix towards year-end. Increases in total cash costs which rose by 17% to R106,748/kg (\$411/oz) were mainly due to increases in major input costs of labour, power and consumables.

Growth prospects

Exploration and drilling programmes are being undertaken to determine the extent and accessibility of the extensive resource to the west of current mining activities and to identify potential mining prospects. The restructuring programme instituted at Savuka over the last two years has made the mine more cost effective, thereby increasing its life of mine.

Outlook

Production at Savuka is forecast to be approximately 2,090 kilograms (65,000 ounces) at a total cash cost ranging from \$440/oz to \$460/oz in 2009. Capital expenditure of R104 million (\$11 million) is planned to be spent mostly on Ore Reserve development.

Carina Smith-Morgan

Communications Officer,

Mponeng and Savuka mines, Mine Services, South Africa

“I ‘live’ two of our values every day: one, “We treat each other with dignity and respect” through my communications interactions and two, “The communities and societies in which we operate will be better off for AngloGold Ashanti having been there” when I’m wearing my responsibility cap for the Local Area Committee duties.”

Annual Report 2008

– 44 –

TAUTONA

Description

TauTona lies on the West Wits Line, just south of Carletonville in North West Province and about 70 kilometres south-west of Johannesburg. Mining at TauTona takes place at depths ranging from 2,000 metres to 3,640 metres. The mine has a three-shaft system and is in the process of converting from longwall mining to scattered grid mining. The mine consists of a main shaft system supported by secondary and tertiary shafts. TauTona shares a processing plant with Savuka. The plant uses conventional milling to crush the ore and a carbon-in-pulp plant to treat the ore further. Once the carbon has been added to the ore, it is transported to the gold plant at Mponeng for electro-winning, smelting and the final recovery of the gold.

Safety

Safety improved overall and the LTIFR for the year was 13.46 per million hours worked (2007: 18.14) and there were four fatalities (2007: five), the major causes of which were seismicity-related rockfalls.

Operating review

Gold production declined by 23% to 9,769 kilograms (314,000 ounces) (2007: 12,714 kilograms; 409,000 ounces). There was a greater-than-scheduled decline in the volume of ore mined, a result of continued seismic activity in the vicinity of the CLR shaft pillar, which is being mined, and at several high-grade production panels, where production was temporarily halted during the course of the year. This seismic activity affected both face length and face advance. The increased geological risk from this seismic activity necessitated re-planning regarding mine layout and mining methods. The power crisis at the beginning of the year also had negative consequences for production.

The decline in production, together with increased input and labour costs, the escalating cost of power and work stoppages contributed to a 36% increase in total cash costs to R97,483/kg (\$374/oz).

Capital expenditure of R491 million (\$60 million) was 2% less than the previous year, and was spent mainly on Ore Reserve development and the below 120 project.

Growth prospects

The three growth projects at TauTona are:

•

CLR below 120 level project is accessed via a twin-decline system down to 128 level. Production was scheduled to begin in 2009. Current estimations are that the project will produce 2.5 million ounces of gold. The project scope has been revised and limited to the development of a rock decline to 123 level. A study will be done to investigate whether the project should be resumed after a year's delay, and whether it should be operated with an owner mine team or together with a contractor. The project has total budgeted capital expenditure of R1.2 billion (\$146 million) of which R620 million (\$76 million) has been spent to date.

•

CLR shaft pillar extraction project enables stoping operations to be conducted up to a recently revised infrastructural zone of influence. Production from this project, which began in 2004 and will continue until 2009, is estimated to total more than 415,000 ounces at an average cash cost of \$102/oz (nominal terms) during this period. Capital expenditure for this project is R281 million (\$34 million) at current exchange rates, most of which has been committed.

•

VCR pillar project, which accesses the VCR pillar area located outside the zone of influence, began production in 2005. Development is scheduled to be completed in 2010. Total production is estimated at almost 218,000 ounces at a capital cost of R123 million (\$15 million), of which R118 million (\$14 million) has been spent to date.

Outlook

Production in 2009 is projected to decrease by 5% to 9,296 kilograms (295,000 ounces) at a total cash cost of between \$330/oz and \$350/oz. Capital expenditure of R433 million (\$44 million) is planned.

South Africa, TauTona

Annual Report 2008

– 46 –

VAAL RIVER

The Great Noligwa, Kopanang, Moab Khotsong and Tau Lekoa mines are situated near the towns of Klerksdorp and Orkney on the border of North West Province and the Free State. The AngloGold Ashanti Vaal River operations have among them four gold plants, one uranium plant and one sulphuric acid plant. Combined, the Vaal River operations (including surface operations) produced 34,785 kilograms (1,119,000 ounces) of gold, equivalent to 22% of group production.

GREAT NOLIGWA

Description

Great Noligwa adjoins Kopanang and Moab Khotsong and is located close to the town of Orkney on the Free State side of the Vaal River. The Vaal Reef, the primary reef, and the Crystalkop Reef, a secondary reef, are mined here. This mining operation consists of a twin-shaft system and operates over eight main levels at an average depth of 2,400 metres. As from the end of June 2008, the SV4 section was transferred from Great Noligwa to Moab Khotsong.

Owing to the geological complexity of the orebody, a scattered mining method is employed. Great Noligwa has its own dedicated milling and treatment plant which applies conventional crushing, screening semi-autogenous grinding and carbon-in-leach processes to treat the ore and extract the gold.

Safety

Great Noligwa achieved OHSAS 18001:2007 certification during the year and received its tenth one million fatality-free shifts award on 25 September 2008. Safety as measured by the LTIFR deteriorated slightly. The LTIFR for the year was 14.66 per million hours worked (2007: 14.46). There was regrettably one fatality in 2008,

Operating review

Production declined by 32% to 10,268 kilograms (330,000 ounces) in 2008. Tonnes mined decreased by 34%. The fall in production was largely attributable to the transfer of the high-grade SV4 section to Moab Khotsong from where it can be more easily accessed. Power savings initiatives during the first quarter of the year and safety stoppages further contributed to the decline in production.

 Annual Report 2008

– 47 –

The overall unit cash cost for the year rose by 31% to R119,140/kg (\$458/oz). This increase in costs was the result of lower production volumes and inflationary pressures on the major input costs of power, labour, support

and stores. This was offset by an increase in uranium by-product credits as a result of improved production and the cancellation of loss-making uranium contracts.

Capital expenditure totalled R213 million (\$26 million) and was spent on ore reserve development and stay-in-business capital.

Growth prospects

As the operation ages, Great Nologwa is in the process of converting from conventional scattered mining to pillar or remnant mining for the remainder of its operational life. Up until now the Vaal Reef has been the most economically viable reef to mine, but as this reef is being mined out, the less economical Crystalkop Reef is being exploited increasingly as are the economically viable support pillars containing the Vaal Reef within the mine's boundaries.

Outlook

Production in 2009 is scheduled to decline by around 30% to around 7,000 kilograms (220,000 ounces) at a total cash cost of between \$460/oz and \$480/oz. Capital expenditure of R198 million (\$20 million) is planned to be spent mainly on further ore reserve development.

Mali, Yatela

Annual Report 2008

– 48 –

KOPANANG

Description

Kopanang adjoins Great Nologwa and is located close to the town of Orkney on the Free State side of the Vaal River. The major reef mined at Kopanang is the Vaal Reef, while a secondary reef, the Crystalkop Reef, is mined on a smaller scale. Mining operations are conducted at depths ranging from 1,350 metres to 2,240 metres.

The Kopanang operation comprises a single shaft system. Given the geologically complex orebody occurring at Kopanang, a scattered mining method is used with the orebody being accessed mainly via footwall tunnelling, raised on the dip of the reef and stoped on strike. Kopanang has a gold processing plant that uses both conventional semi-autogenous grinding and carbon-in-pulp technology. There are two streams of ore into the plant, one of which is fed mainly by Vaal Reef ore while the other is fed exclusively by Ventersdorp Contact Reef ore from Tau Lekoa.

Safety

The mine retained its OHSAS 18001:2007 certification during the year. There was an improvement in safety performance during 2008 with a reported LTIFR for the year of 12.86 per million hours worked (2007: 13.10) and FIFR of 0.14 (2007: 0.22). There were two fatalities, one caused by a tramming accident and the other a fall of ground. Kopanang also received its eighth one million fatality-free shifts award on 11 November 2008. Seven one million fatality-free shifts have been achieved in the past eight years.

Operating review

Gold production decreased to 11,244 kilograms (362,000 ounces), 14% less than the previous year. Lower volumes mined (11% down) coupled with a 6% fall in grade to 6.8 g/t were the major contributions to the production decline. Power outages during the first quarter coupled with related work stoppages contributed to the decline in volumes mined.

Unit total cash cost increased by 32% to R91,516/kg (\$348/oz) as a result of the reduced production and increases in the prices of major input costs at rates higher than the CPI.

Growth prospects

A new waste washing plant is planned for 2009. The plant will upgrade the quality of the fines to be added to the Kopanang stream as well as that of the tonnes to be sent to the plant at Great Noligwa for uranium extraction.

The orebody to the west of Kopanang's current mining area is being drilled which, if it proves viable, will extend the life of mine.

Outlook

The overall yield of ore mined is expected to decline in 2009 as the mining of lower grade panels located further from the shaft come into production. The production profile should increase, provided fewer stoppages are experienced, and additional development is planned to overcome problems regarding face length in order to create flexibility.

Gold production is forecast to be around 12,441 kilograms (400,000 ounces) in 2009 with total cash costs estimated to be in the region of between \$275/oz and \$295/oz. Capital expenditure is planned to increase to R514 million (\$53 million), to be spent primarily on the uranium expansion programme, metallurgical improvements and an increase in ore reserve development to improve mining flexibility.

Moab Khotsong, South Africa

Annual Report 2008

– 50 –

TAU LEKOA

Description

Tau Lekoa is one of four mining operations in the Vaal River area. It is close to the town of Orkney on the North West Province side of the Vaal River. Unlike the other Vaal River operations, the major reef mined at Tau Lekoa is the Ventersdorp Contact Reef. Mining operations are conducted at depths ranging from 800 metres to 1,743 metres, making this one of the shallower AngloGold Ashanti mines in South Africa.

The Tau Lekoa operation comprises a twin-shaft system. Because of the geologically complex orebody occurring at Tau Lekoa, a scattered mining method is used with the orebody being accessed via footwall tunnelling while stoping takes place on strike. There are currently seven shaft levels with an average of 70 panels in operation. Tau Lekoa employs hydro-electric power as its primary source of energy.

Ore mined by Tau Lekoa is processed and treated in preparation for gold extraction at the Kopanang gold plant.

Safety

The mine achieved OHSAS 18001:2007 certification during the year. Safety as measured by the rate of lost-time injuries improved to 16.57 per million hours worked compared to 19.07 in 2007. There were no fatalities at Tau Lekoa in 2008.

Operating review

Production declined as planned by 13% to 4,444 kilograms (143,000 ounces) in 2008. This is largely attributable to a 12% decline in volumes mined which were affected by the power outages during the first quarter of 2008 and by safety related stoppages throughout the year.

Total cash costs rose 31% to R140,368/kg (\$533/oz) compared with R107,016/kg (\$474/oz) the previous year, largely owing to reduced production and inflationary pressures on input costs.

Annual Report 2008

– 51 –

Capital expenditure for the year totalled R146 million (\$18 million) (2007: R113 million; \$16 million), of which \$13 million was spent on Ore Reserve development with the balance being spent mainly on the upgrade of the surface refrigeration plant.

Growth prospects

On 17 February 2009, AngloGold Ashanti announced that it had agreed to sell, with effect from 1 January 2010

(or after), the Tau Lekoa mine to Simmer & Jack Mines Limited.

Outlook

Production in 2009 is projected to decrease to around 4,500 kilograms (150,000 ounces) at a total cash cost of between \$455/oz and \$475/oz. Capital expenditure of R140 million (\$14 million) is planned.

Corporate Office Johannesburg

“I am employed by a company that portrays an excellent corporate citizenship image and has strong values. Those factors are essential to me. Values determine the company culture and the common language for employees. People need to be aligned in their thinking to show the outside world what the company stands for.”

Annual Report 2008

– 52 –

MOAB KHOTSONG

Description

Moab Khotsong, the newest of AngloGold Ashanti's South African operations, began commercial production in January 2006. Located south and south-east of Great Noligwa and Kopanang in the Free State province, Moab Khotsong was developed to exploit the Vaal Reef. The first phase of this operation included the development of a main shaft system, a subsidiary ventilation shaft and three main production levels to between 2,600 metres and 3,054 metres below surface.

Given the known geological complexity of the Vaal Reef, a scattered mining method has been employed with haulages, cross cuts and raises pre-developed in a grid system.

Safety

Moab Khotsong achieved OHSAS 18001:2007 certification during the year and received a one million fatality-free shifts award on 21 July 2008. Safety performance improved overall at Moab Khotsong which had an LTIFR for the year of 11.98 per million hours worked (2007: 13.48). There was one fatality in 2008 compared with five in 2007.

Operating review

Production continued to ramp-up with 5,965 kilograms (192,000 ounces) being produced in 2008 (2007: 2,081 kilograms; 67,000 ounces). Of this, 2,194 kilograms (71,000 ounces) were produced in the fourth quarter alone. Great Noligwa's SV4 section was transferred to Moab Khotsong at the end of June 2008, contributing 2,433 kilograms (77,000 ounces) for the six-month period July to December 2008. Moab Khotsong is scheduled to reach full annual production of 13,575 kilograms (436,000 ounces) in 2011. Development of Moab Khotsong was completed by December 2007 at a total cost of R4,193 million (\$599 million at an average exchange rate of R7/\$).

The values mined and volumes treated increased by 29% and 145% respectively. This was mainly due to the ramp up and transfer of Great Noligwa's SV4 section to Moab Khotsong.

Total cash cost reduced 32% to R102,216/kg (\$379/oz) compared to R150,135/kg (\$668/oz) the previous year. Unit costs were positively affected by the higher level of production, which helped to offset higher labour and power costs, and losses on uranium contracts.

Annual Report 2008

– 53 –

Capital expenditure for the year totalled R736 million (\$89 million) (2007: R628 million; \$89 million) – 66% of total capital spent was for Ore Reserve development, the remainder was mainly on stay-in-business projects as well as the Zaaiplaats project.

Growth prospects

A study is underway on the optimal extraction of the orebody within the lower mine area of Moab Khotsong (beneath the farm Zaaiplaats), focusing on the main, higher-value portion. The aim is to create as continuous a mine as possible, understanding that the window of opportunity for seamless integration has largely passed.

Outlook

Production in 2009 is projected to be around 10,000 kilograms (300,000 ounces), an increase of 70%, at a total cash cost of between \$280/oz and \$300/oz. Capital expenditure of R719 million (\$74 million) is planned, mostly on ore reserve development with the remainder being stay-in-business expenditure as well as for surface drilling.

Veronica Thokozani Wanda

Community and Social Development Officer

Southern African Division

“Working with people living with disabilities, and being a leader, constantly reminds me that safety is our first value. I also have the responsibility of conveying this message to all employees through visible safety actions.”

Annual Report 2008

– 54 –

CERRO VANGUARDIA

Description

AngloGold Ashanti has a 92.5% interest in Cerro Vanguardia with Formicruz (the province of Santa Cruz) owning the remaining 7.5%. Located to the north-west of Puerto San Julian in the province of Santa Cruz, Cerro Vanguardia consists of multiple small open pits with high stripping ratios. The orebodies comprise a series of hydrothermal vein deposits containing gold and large quantities of silver, which is produced as a by-product.

Ore is processed at the metallurgical plant which has a capacity of 2,800 tonnes per day and includes a cyanide recovery plant. Technology at the plant is based on conventional leaching process in tanks and carbon-in-leach with a tailings dam incorporated in a closed circuit. The final recovery of gold and silver is achieved through a Merrill Crowe Method with metallic zinc.

Safety

Safety at Cerro Vanguardia deteriorated during the year. The LTIFR for 2008 was 3.98 per million hours worked compared to 3.34 in 2007. As in 2007, there were no fatalities. Corrective action was taken during 2008 to improve safety performance that included conducting safety awareness workshops for the managers responsible for operational safety, and for supervisors and contractors.

Operating review

Attributable gold production decreased by 25% to 154,000 ounces for the current year. This decline was mostly as a result of intermittent plant breakdowns that resulted in reduced tonnage throughput and poor grade recovery due to unexpected changes in soil composition. Management changes were implemented resulting in improved plant availability and recovered grade in the latter part of the year.

In 2008, total cash costs rose to \$608/oz from \$261/oz in 2007, reflecting chiefly reduced volumes mined and lower grades as well as lower gold and silver production due to periodic plant breakdowns. Additional factors affecting costs were increases in the cost of mining supplies, a function of the inflationary impact of higher commodity prices and higher maintenance costs (due to an extension on the useful life of some mine equipment), as well as an increase in workforce/contractor costs and a decrease in by-product credits resulting from lower silver sales.

Capital expenditure for the year amounted to \$16 million, spent largely on mine equipment, the dispatch system, exploration and plant infrastructure.

Annual Report 2008

– 55 –

Growth prospects

The four-year brownfields exploration programme entered its third year in 2008. The focus of the programme is to determine the life of mine and to delineate the shallow, high-grade Mineral Resource. In all 300,000 ounces of gold and 8 million ounces of silver were added to Mineral Resources during 2008.

During 2009, Cerro Vanguardia will start the study on underground mining of the current high-grade and high-stripping ratio open-pit reserves. This project will allow Cerro Vanguardia to reduce the stripping ratio from 25:1 to around 15:1, improve the capital efficiency of the current operation and optimise the feed grade. Development is estimated to start during 2009 with production scheduled to begin in 2010. This mining method at Cerro Vanguardia is estimated to produce approximately 560,000 ounces of gold and 6.3 million ounces of silver.

During 2009, the heap-leach study, investigating the treatment of the low-grade resources at Cerro Vanguardia by a small, heap-leaching operation, will be reviewed and updated. This update will also consider synergies with the new underground mining project. The heap-leach project will increase Cerro Vanguardia's gold production by around 25,000 ounces of gold annually, if approved.

Outlook

Attributable gold production for 2009 is projected to be approximately 160,000 ounces at a total cash cost of between \$410/oz and \$430/oz. Gold recovered grade is predicted to be 6.3 g/t. Attributable capital expenditure of \$20 million is scheduled for 2009, to be spent mostly on the study, development and construction of underground facilities, as well as the improvement of plant infrastructure.

Daniel Pugnalaní

Short Term Mine Planning Assistant

Cerro Vanguardia, Argentina

“My job is to collate information from the different disciplines here at Cerro Vanguardia, such as topography, geology and drilling – from there we can do short term planning. It gives me great pleasure to see the emphasis the company puts on safety, the protection of the environment and team work.”

Annual Report 2008

– 56 –

AngloGold Ashanti's three assets in Australia are the Sunrise Dam gold mine, and the Boddington and Tropicana joint venture projects. In 2008, production from Sunrise Dam was 433,000 ounces, a decline of 28% from 2007 and equivalent to 9% of group production for the year.

At year-end ownership of these assets, all in the state of Western Australia, was as follows:

- The Sunrise Dam gold mine which is 100% owned by AngloGold Ashanti and currently the only producing AngloGold Ashanti operation in Australia.

- The Boddington project, a joint venture between AngloGold Ashanti (33.33%) and Newmont Mining Corporation (66.67%).

- The Tropicana project, a joint venture between AngloGold Ashanti (70%) and Independence Group NL (30%).

SUNRISE DAM*Description*

The Sunrise Dam gold mine is located in the northern goldfields of Western Australia, 220 kilometres north-east of Kalgoorlie and 55 kilometres south of Laverton. The mine consists of a large open pit, which is now in its twelfth year of operation, and an underground mine, which began producing in 2003. Mining at both operations is conducted by contractors and the ore mined is treated in a conventional gravity and carbon-in-leach processing plant which is owner-managed.

Safety

No fatalities were recorded and there was an improvement in the rate of lost-time injuries. The LTIFR for the year was 1.83 per million hours worked (2007: 2.63).

Operating review

Production decreased by 28% to 433,000 ounces in line with expectations as mining of the high-grade ore in the base of the Mega Pit was completed. Mill feed comprised stockpiled ore and approximately 73,000 ounces of gold production was sourced from the underground mine where 2,107 metres of underground capital development and 6,661 metres of operational development were completed. A total of 41,417 metres of diamond drilling was also completed.

Annual Report 2008

– 57 –

Processing plant throughput in 2008 was 3.8 million tonnes, equal to throughput in 2007.

The conversion of the mine's diesel power station to liquefied natural gas (LNG) was delayed by an explosion at the Varanus Island gas production installation and the LNG facility will begin operation in the first quarter of 2009.

Total cash costs increased by 75% to A\$619/oz (an increase of 74% in US dollar terms to \$531/oz). Cash costs

were impacted by significantly higher input costs, specifically for fuel and labour, during the year. Capital expenditure for the year amounted to A\$23 million (\$19 million).

Growth prospects

The main open pit (the Mega Pit), with a final depth of 440 metres was completed during 2008. A cutback of the north wall of the open pit is underway and is scheduled for completion in mid-2010. Ore from the cutback will be blended with stockpiled ore and ore from the underground mine.

Successful exploration and advances in geological understanding have resulted in further growth in underground reserves which increased to 1.01 million ounces (after depletion). Underground resources at year-end were 2.49 million ounces (indicated 1.44 million ounces). Total reserves (after depletion) at the mine at year-end were 1.9 million ounces and total resources (after depletion) were 3.85 million ounces.

Outlook

Gold production for 2009 is projected to be approximately 410,000 ounces, with more than 120,000 ounces sourced from the underground mine. Underground production will continue to ramp up for the next several years, with a current peak capacity target of 200,000 ounces per year.

Total cash costs are estimated to be between A\$785/oz and A\$815/oz (\$530/oz and \$550/oz) while capital expenditure is scheduled to be A\$25 million (\$17 million) – to be spent primarily on the underground mine.

Annual Report 2008

– 58 –

BODDINGTON*Description*

Boddington is located 130 kilometres south-east of Perth in Western Australia. The original, predominantly oxide open-pit operation was closed at the end of 2001. Construction of the Boddington Expansion Project, which will mine the extensive basement reserves beneath the oxide pits, was approved in March 2006 and was well advanced by year-end.

Operating review, growth prospects and outlook

Development of the expansion project was approximately 88% complete at year-end, with AngloGold Ashanti contributing \$419 million towards capital costs in 2008. Subsequent to the financial year-end, AngloGold Ashanti announced the sale of its 33.33% stake in Boddington to the Newmont Mining Corporation.

TROPICANA*Description*

The Tropicana Joint Venture comprises more than 13,000 square kilometres of tenements stretched along more than 300 kilometres of the ancient collision zone between the Yilgarn Craton and the Albany Fraser Province in Western Australia. The Tropicana Gold Project is located 330 kilometres east-north-east of Kalgoorlie within the northern part of the joint venture area. AngloGold Ashanti holds a 70% interest in the Tropicana JV and Independence Group NL holds a 30% interest.

Operating review, growth prospects and outlook

The pre-feasibility study on the Tropicana Gold Project began in June 2007. The study, which focuses on the Tropicana and Havana zones, is scheduled for completion in the second quarter of 2009.

Annual Report 2008

– 59 –

The emphasis of drilling at the Tropicana Gold Project has been to increase the confidence of the resource estimate, which has increased by almost 1 million ounces. The resource comprises a Measured 19.9 million tonnes grading 2.38g/t, an Indicated 31.0 million tonnes grading 2.06 g/t and an Inferred 24.3 million tonnes grading 1.83g/t for a total resource estimate of 75.3 million tonnes grading 2.07g/t and containing 5 million ounces of gold.

Metallurgical testwork and engineering studies have determined that the preferred plant configuration is a conventional carbon-in-leach circuit. Energy efficiency is an important consideration for the project with studies focused on assessment of the optimal crushing and grinding circuit, which will include energy-efficient high-pressure grinding rolls. A wide range of processing rates of up to 7.5 million tonnes per annum have been evaluated. Further pre-feasibility study level work is being undertaken to optimise mine planning and scheduling as a result of the increase in resources. A comprehensive review of electrical power options is in progress with the objective of achieving low operating costs. Diesel, gas, electrical grid reticulation and solar thermal power are being evaluated.

Extensive baseline environmental studies for the project have been substantially completed with formal submission of major Environmental Impact Assessment documents scheduled for early 2009. It is anticipated full environmental permitting of the project will take approximately 12 months to complete.

Regional exploration continues on the greater tenement package (see the Global exploration section of this report for additional information).

Luke Bergin

Senior Project Geologist, Perth Office, Australia

“I believe Corporate Social Investment (CSI) is an integral part of any company’s strategy, and it is important that AngloGold Ashanti is committed to ensuring that our host communities have a sustainable future.”

Annual Report 2008

– 60 –

The two AngloGold Ashanti assets in Brazil are AngloGold Ashanti Brasil Mineração and Serra Grande. In 2008, these operations together produced an attributable 407,000 ounces of gold, equivalent to 8% of group production.

ANGLOGOLD ASHANTI BRASIL MINERAÇÃO*Description*

The wholly-owned AngloGold Ashanti Brasil Mineração (Brasil Mineração) complex is located in south-eastern Brazil in the state of Minas Gerais, close to the city of Belo Horizonte, in the municipalities of Nova Lima, Sabará and Santa Bárbara. Ore is sourced from the Cuiabá underground mine, and then processed at the Cuiabá and Queiroz plants, and from the Córrego do Sítio heap-leach operation.

Safety

Safety levels deteriorated during the course of the year with the LTIFR at 3.06 per million hours worked in 2008 as opposed to 2.30 in 2007. A safety programme to restore former levels of safety performance and renew awareness of the importance of working safely among employees has been put in place. There were no fatalities in 2008.

Operating review

Gold production for 2008, supported mainly by the Cuiabá mine, where the expansion project has been completed, and the Córrego do Sítio mine, was almost unchanged in line with expectations at 320,000 ounces. From an operating perspective, the development rate at Cuiabá improved as planned with a focus on greater mine flexibility. Strategic action was taken to enhance long-term performance at Cuiabá and extend its life of mine. This included increasing the backfill rate to the mine, re-structuring the maintenance programme and reviewing maintenance contracts, as well as implementing a management strategy focusing on cost optimisation in 2009. Also introduced were new preventive controls and the monitoring of geotechnical conditions and the stability of the hangingwall in particular. All of these actions are aimed at consolidating a sustainable long-term rate of production.

Total cash costs rose by 29% to \$300/oz. Higher costs were largely a result of the appreciation of the local Brazilian currency (the real) against the US dollar and higher inflation on materials, services and maintenance costs, partially offset by the better price received for sulphuric acid by-product.

Annual Report 2008

– 61 –

Capital expenditure for the year totalled \$69 million, significantly lower than the \$117 million spent in 2007 given the completion of the Cuiabá Expansion Project. Expenditure in 2008 was mostly on increasing ore development and the acquisition of new equipment to enhance the rate of development at the Lamego and Córrego do Sítio projects.

Growth prospects

The Córrego do Sítio Underground Sulphide Project continues and will exploit the sulphide resources of the Córrego do Sítio underground orebodies, namely Cachorro Bravo, Laranjeiras and Carvoaria Velha. The project estimates production of 90,000 ounces of gold annually from a total of 5.4Mt of ore milled. Full production is scheduled to begin in 2012.

The development of a ramp and exposure of the Cachorro Bravo and Laranjeiras orebodies continues as does the access drives to the Carvoaria Velha orebody. Exposure of the Laranjeira orebody, to increase the extent of the mineable resources, has begun. Trial mining on the Cachorro Bravo orebody is in progress and operational mining parameters for the feasibility study are being confirmed. Two mine methods are being tested: sub-level stoping and cut-and-fill mining. The metallurgical process is being confirmed and indications are that pressure oxidation via autoclaves will be the best option given the characteristics of the ore.

In December 2008, AngloGold Ashanti acquired the São Bento mine, a Brazilian gold mining operation that was wholly-owned by Eldorado Gold Corporation and held in São Bento Mineração S.A., an indirect, wholly-owned subsidiary of Eldorado. The São Bento mine is located in the vicinity of the Córrego do Sítio mine, in the municipality of Santa Bárbara in the Iron Quadrangle region of Minas Gerais State. This acquisition will double the scale and enhance the feasibility of the Córrego do Sítio Project, thus enhancing the dominant position of AngloGold Ashanti as a gold producer in Brazil's Iron Quadrangle.

During 2008, development at the Lamego Project which explores the orebodies on the Lamego property close to the Cuiabá mine, totalled 4,063 metres. Lamego is expected to produce approximately 345,000 ounces of gold over nine years from 2.14Mt of milled ore. Production is scheduled to start in mid-2009. Given the same elliptical structure and the project's proximity to Cuiabá, ore mined here will be treated at the Cuiabá plant – this was factored into the recently completed expansion project at Cuiabá.

Annual Report 2008

– 62 –

The Raposos Project explores the re-opening of the Raposos mine that was mothballed in 1998 when the gold price was less than \$300/oz. The existing underground and surface infrastructure at Raposos Mine was reviewed and new technical recommendations made on adapting the existing facilities to the new requirements. The project is based on the ore resources defined in the mine evaluation block between mine levels 34 and 44, totalling 2Mt at 7g/t Au with 530,000 ounces of gold content. The ore mined here will be processed using idle capacity at the Queiroz plant. A feasibility study is being prepared for submission to the board for approval during 2009. Production is expected to begin in 2011 with development activities progressing from 2009 and 2010.

Outlook

Production at Brasil Mineração in 2009 is likely to be at levels similar to those of 2008, around 320,000 ounces, with production from the Lamego project offsetting lower production at Cuiabá and Córrego do Sítio. In line with this, total cash costs are expected to range from \$280/oz to \$330/oz while planned capital expenditure of approximately \$94 million will be spent predominantly on mine development and projects.

SERRA GRANDE*Description*

Serra Grande is located in central Brazil, in the state of Goiás, five kilometres from the city of Crixás. AngloGold Ashanti and the Kinross Gold Corporation are joint partners in this operation. In terms of the shareholders' agreement, AngloGold Ashanti manages the operation and has the right to access a maximum of 50% of the earnings accrued and dividends paid by Serra Grande.

Serra Grande comprises two underground mines, Mina III and Mina Nova, an open pit at Mina III, and a new mine named Palmeiras where the main ramp development began in May 2008. Production here will begin in 2009, during development. Annual capacity of the processing circuit, which has grinding, leaching, filtration, precipitation and smelting facilities, is being expanded from about 818,000 tonnes annually to 1.150Mt annually. This expansion is expected to be completed by mid-2009.

Safety

There was an improvement in safety regarding lost-time injuries during the course of the year with an LTIFR of 1.72 per million hours worked compared with 2.47 in 2007. Unfortunately, there was one fatality in the first quarter of the year (2007: one), a result of an incident involving a truck, which gives a FIFR of 0.43 per million hours worked (2007: 0.49).

Operating review

Attributable production of 87,000 ounces in 2008 represents a decrease of 5% from the previous year. This was chiefly due to the lower tonnage of ore treated at the underground operation. Palmeiras Mine has a resource of 207,000 ounces and is expected to start operating in 2009 with average annual production of 16,000 ounces from 2010.

Total cash costs increased by 12% to \$294/oz, again largely due to reduced production, the appreciation of the Brazilian real and inflation, which affected the cost of power, labour, fuel and maintenance services. Capital expenditure amounted to \$41 million, of which \$20 million was attributable. This was expended mostly on the plant expansion project, mine development, the main ramp at the Palmeiras mine and resource definition.

Growth prospects

An aggressive brownfields exploration campaign at Serra Grande aims to increase reserves and resources in and around Mina III and Mina Nova. In 2008, there was an increase in resources and reserves at Serra Grande with the discovery last year of the Pequizão orebody that is located between Mina Nova and Mina III. In 2008, exploration activities focused on evaluating the Pequizão strike and down-plunge extension as well as on investigating the continuity of Palmeiras, Orebody V and Mina Nova.

Outlook

In 2009, attributable gold production at Serra Grande is projected to be around 80,000 ounces, a decrease of about 8% given the lower grades to be mined, partially offset by higher tonnages as a result of the expansion. Total cash costs are expected to range from \$340/oz to \$360/oz and capital expenditure of \$56 million (of which \$28 million is to AngloGold Ashanti) is to be spent predominantly on mine development, the mine fleet, the completion of the plant expansion project, raising the walls of the tailings dam and other operational improvements.

Annual Report 2008

– 64 –

The two AngloGold Ashanti operations in Ghana, Obuasi and Iduapriem, had combined total attributable production of 557,000 ounces, equivalent to approximately 11% of group production, for the year.

OBUASI

Description

Obuasi, which is wholly owned by AngloGold Ashanti, is located in the Ashanti region of southern Ghana, approximately 80 kilometres from Kumasi. It is primarily an underground mine operating at depths of 1,500 metres, although some surface mining does occur. Three treatment plants process the ore: a sulphide plant treats the ore from underground, a tailings plant undertakes tailings reclamation and an oxide plant is used to batch treat remnant open-pit ore and stockpiles.

Safety

Regrettably there were two fatalities during the year (2007: four), one caused by an accident involving a fall of ground and one by an accident involving machinery. The LTIFR for the year improved to 2.10 per million hours worked, from 2.72 in 2007. The FIFR also improved to 0.10 in 2008 from the previous 0.19 per million hours worked in 2007.

The process to obtain OHSAS 18001:2007 accreditation for Obuasi was completed in December 2008 after a successful certification audit.

Operating review

The marginal decline of less than 1% in annual production to 357,000 ounces in 2008 was a result of a decrease in underground volumes and the grade mined, as well as unscheduled work stoppages at the plant for repairs and maintenance to the ball mill during the year. Water quality issues affected mill tonnages twice during the year and were exacerbated by the delay in the commissioning of the tailings sulphide plant to mid-2009. However production did improve as the year progressed, particularly in the second half of the year as the results of the short-term turnaround project at Obuasi became apparent. Development metres increased, contributing to greater mining flexibility which delivered a greater throughput of tonnes and improved grades in the second half of the year.

 Annual Report 2008

– 65 –

Following plant maintenance around mid-year and the commissioning of a larger regrind mill, metallurgical recoveries did improve in the second half of the year – although overall these too were marginally down on the year.

The 38% increase in total cash costs was due primarily to inflationary pressures resulting in substantial increases in power tariffs, contractor costs and the price of fuel and reagents over the year, as well as higher royalty payments.

Capital expenditure totalled \$112 million and was spent on projects \$16 million, ore reserve development \$44 million and stay in business capital \$52 million.

Growth prospects

While Obuasi is currently a focus of the short-term business turnaround plan it is also an initial target of the group's longer-term business improvement plan, the aim of which is sustained improvements to operational performance and efficiencies. At Obuasi in particular, this strategy aims to increase development metres, which are essential to mining flexibility, to improve the volumes processed and recovered by the sulphide plant by enhancing the grinding and flotation functions, to increase productivity and improve maintenance. The aim is to increase monthly ore production by 35%, grade to 7g/t by end-2009 and metallurgical recoveries at the sulphide plant to 83% by mid-2009. The number of areas being mined will be consolidated to 10 (from 14) and development metres increased so as to ensure 18 months of reserves. In addition, high speed development crews will be used to target selected areas. Changes to the mining method include a preference for longitudinal mining and increasing the stope length to a maximum of 70 metres.

Outlook

Production at Obuasi is forecast to be around 400,000 ounces in 2009, at an estimated total cash cost of between \$620/oz and \$640/oz. Planned capital expenditure is expected to be approximately \$126 million, to be spent on projects \$22 million, stay-in-business capital \$65 million and ore reserve development \$39 million.

Annual Report 2008

– 66 –

IDUAPRIEM

Description

Iduapriem comprises two properties, Iduapriem and Teberebie. The Iduapriem mine is situated in the western region of Ghana, some 70 kilometres north of the coastal city of Takoradi and 10 kilometres south-west of Tarkwa. Iduapriem is an open-pit mine and its processing facilities include a carbon-in-pulp (CIP) plant.

Safety

Despite the heightened focus on training and education, safety performance deteriorated during the year. The LTIFR was 1.63 per million hours worked (2007: 0.46). There were no fatalities.

Iduapriem achieved OHSAS 18001 certification in January 2008 after a successful certification audit.

Operating review

Despite the decline in grade mined, attributable production increased by 8% to 200,000 ounces. Crushed tonnage improved significantly by 26% mainly due to commissioning of the Scats crusher in the first quarter and a marked improvement in blast fragmentation, assisting throughput in the second half of the year, despite problems experienced in the first and third quarter with mill gearbox and crusher component failures.

Recovered grade declined by 5% mainly due to a reduced head grade and lower recoveries during the first half of the year. Mechanical upgrading of the hydraulic flow path in the leach section improved residence time and recoveries during the fourth quarter.

Total cash costs increased by 41% on the year to \$525/oz as a result of substantial increases in power tariffs during the second half of the year, higher royalty payments and contractor costs; and a surge in the price of fuel and consumables.

Capital expenditure for the year amounted to \$54 million, spent primarily on the advancement of the plant expansion project. Due to delays experienced in the delivery of long-lead critical items, project commissioning, originally scheduled for the fourth quarter of 2008, has been postponed to the first quarter of 2009.

Annual Report 2008

– 67 –

Growth prospects

While the mine has limited growth prospects on surface, the recent surge in the gold price has led to renewed interest in evaluating the considerable low-grade Mineral Resources of other properties lying in the Tarkwaian conglomerates that extend below the economic limits of the existing pits. Additional drilling to give more confidence to existing data has been scheduled for 2009 and the scoping study will subsequently be

progressed to the pre-feasibility stage.

Outlook

Production at Iduapriem is projected to remain constant at approximately 200,000 ounces in 2009. Total cash costs are estimated to range from \$540/oz to \$560/oz with planned capital expenditure of around \$24 million, to be spent primarily on the completion of the expansion project and the establishment of the Ajopa pit.

Grace Lina Ansah

Occupational Health Superintendent

Iduapriem, Ghana

“Values are important for a company and its employees. They guide employees’ professional conduct and also inform the vision of the company. AngloGold Ashanti’s values help us to respect each other and the environment.”

Annual Report 2008

– 68 –

AngloGold Ashanti has one gold mining operation, Siguiri, in the Republic of Guinea. Siguiri produced 333,000 attributable ounces of gold in 2008, equivalent to 7% of group production.

SIGUIRI*Description*

AngloGold Ashanti has an 85% interest in Siguiri and the government of Guinea has a 15% stake. The Siguiri mine is a conventional open-pit operation situated in the Siguiri district in the north-east of the Republic of Guinea, West Africa, about 850 kilometres from the capital city of Conakry. All ore and waste is mined by a mining contractor and the ore is processed using a carbon-in-pulp (CIP) process. Siguiri mines two types of gold deposits, laterite and in situ quartz-vein related mineralisations that have been deeply weathered to form saprolite mineralisation.

Safety

Overall safety standards were maintained at Siguiri with an LTIFR for the year of 0.42 per million hours worked (2007: 0.41). There were no fatalities.

Following a successful certification audit, the process to obtain OHSAS 18001:2007 accreditation was completed in December 2008.

Operating review

Attributable production increased by 19% to a record of 333,000 ounces in 2008. This increase was a function of improved throughput – the CIP plant performed consistently well throughout the year, with availability of 93%, the processing of 10 million tonnes aided by increased throughput during the wet season and a metallurgical recovery rate of 95.8% for the year – and the mining of higher grade pits early in the year which led to improved yields.

Total cash costs were fractionally higher at \$466/oz (2007: \$464/oz). Cost pressures, resulting from higher unit costs for fuel and reagents were countered by the increased level of production.

 Annual Report 2008

– 69 –

Attributable capital expenditure for the year of \$18 million was spent on brownfields exploration \$12 million and stay in business capital \$6 million.

Growth prospects

It is expected, with the exploration at Kintinian and Sintroko nearing completion, that additional ounces will be converted to reserves in early 2009. Regarding the CIP plant, the designs of a second gravity concentrator and de-gritting facilities are being finalised and these will be installed during 2009; they are expected to improve plant recovery and increase throughput. Studies are underway to increase plant throughput from 2010 onwards.

Outlook

Attributable gold production for 2009 is projected to decline to approximately 300,000 ounces with total cash costs ranging from \$495/oz to \$515/oz. Capital expenditure of \$27 million is scheduled for 2009, to be spent on brownfields exploration \$7 million, stay in business capital \$15 million and projects \$5 million.

Madima Camara

Receptionist

Siguiri, Guinea

“To me, labour practices and good healthcare are important in any business. Here at Siguiri in Guinea, I think there is a lot of emphasis on skills and training, without any discrimination and this contributes to the development of our workforce.”

Annual Report 2008

– 70 –

AngloGold Ashanti has interests in three gold mining operations in Mali, namely, Sadiola, Yatela and Morila. It manages two of these operations, Sadiola and Yatela. Together these three operations had combined attributable production of 409,000 ounces, 8% of group production.

Ownership of these three operations is as follows:

- Sadiola: AngloGold Ashanti and IAMGOLD each have an interest of 38% in the joint venture while the government of Mali has an interest of 18% and the International Finance Corporation, 6%.
- Yatela: this operation is 80% owned by the Sadiola Exploration Company Limited, a joint venture in which AngloGold Ashanti and IAMGOLD each have an effective holding of 50%. The government of Mali owns the remaining 20%.
- Morila: this operation is 80% owned by Morila Limited, a joint venture in which AngloGold Ashanti and Randgold Resources each have an effective holding of 50%. The government of Mali owns the remaining 20%. Randgold Resources took over the management of this operation during 2008. Total attributable production from the Mali operations was 7% down on that of 2007. Overall the total cash cost at these operations was \$430/oz, an annual increase of 23%. This increase was a function of reduced production, a weaker dollar against the euro and significant increases in the price of fuel, mining contract and reagents costs.

SADIOLA

Description

Sadiola is situated in the far south-west of the country, 77 kilometres to the south of the regional capital of Kayes. Mining takes place in five open pits and the ore mined is treated and processed in a 435,000Mtpm (5.2Mtpa) CIP gold plant.

Safety

Overall safety performance improved at Sadiola with an LTIFR for the year of 0.87 per million hours worked (2007: 1.11). There were no fatalities during the year. Sadiola achieved OHSAS 18001:1999 certification in March 2008 after a successful certification audit.

 Annual Report 2008
 – 71 –

Operating review

Attributable production rose by 23% in the year to 172,000 ounces (2007: 140,000 ounces). The major contributor was the improved recovery rates achieved after commissioning of the gravity circuit in December 2007. The new circuit configuration had a major impact on both sulphide and oxide ore recoveries during 2008. Major mechanical breakdowns in the milling section during the second and third quarters were offset by changing the feed blend to the plant to include more higher grade sulphide material.

Total cash costs declined by 4% to \$399/oz (2007: \$414/oz), largely owing to the increased level of production with the resultant economies of scale and a decrease in the consumption of reagents given the change in the ore blending process. The inflationary pressures of higher fuel, reagents and mining contract costs were mitigated by increased production.

Total capital expenditure of \$8 million – attributable \$3 million – was spent during the year with most of this expenditure being on the completion of phase 2 of the gravity circuit installation (\$2.4 million) and on the deep sulphide project (\$2.2 million).

Growth prospects

The review of various options to improve current assumptions in the Deep Sulphide Project continues. The review is focused on the mining method to be implemented, scale, energy consumption, and metallurgical recovery so as to convert the vast indicated resource below the main pit into a reserve. A significant improvement was made in the understanding of sulphide ore recovery in 2008 and the commissioning of the new gravity circuit at the concentrator at the end of 2007 has enabled recovery of the very high-grade sulphide ores on stockpile.

Outlook

Attributable production at Sadiola is projected to be 130,000 ounces at a total cash cost of between \$495/oz and \$515/oz. Capital expenditure of \$8 million (\$3 million attributable) is planned.

Annual Report 2008

- 72 -

YATELA

Description

Yatela is situated some 25 kilometres north of Sadiola and approximately 50 kilometres south-south-west of Kayes. This is a single pit operation. The ore mined is treated at a heap-leach pad together with carbon-loading. The carbon is then eluted and the gold smelted at nearby Sadiola.

Safety

Overall safety performance regressed considerably at Yatela with an LTIFR for the year of 1.15 per million hours worked (2007: 0.39). There were no fatalities during the year. Yatela achieved OHSAS 18001 certification in March 2008 after a successful certification audit.

Operating review

Attributable gold production at Yatela declined by 45% to 66,000 ounces for the year (2007: 120,000 ounces).

The main reason for this decline in production was a marked decrease in head grade owing to underperformance of Pushback 5, which led to lower grade ore being supplied for stacking at the heap-leach pads. Yatela successfully changed the mining contractor employed at the mine during the year.

Total cash costs rose by 78% to \$572/oz, a result of the significantly reduced levels of production, weaker dollar against the euro and higher fuel and reagent prices.

Capital expenditure of \$8 million (attributable \$3 million) in 2008 was spent mostly on the construction of additional leach pads.

MORILA*Description*

The Morila mine is situated some 180 kilometres by road south-east of Bamako, the capital of Mali. Open-pit mining takes place at five pushbacks within one pit. On completion, the Morila pit will be approximately 1.4 kilometres by 1 kilometre and up to 240 metres deep. The plant, which is based on a conventional carbon-in-leach (CIL) process with an upfront gravity section to extract the free gold, has throughput capacity of 4.2Mtpa. The Morila mine is managed by AngloGold Ashanti's joint venture partner, Randgold Resources Limited.

Safety

Safety is under the control and management of Randgold Resources.

Operating review

Attributable gold production at Morila decreased 6% to 170,000 ounces (2007: 180,000 ounces), as a result of changes in the geological model. Closely drilled grade control holes did not confirm the high grades scheduled from the resource, and as a result, lower grades than planned were fed to the processing plant. Volumes mined were 20% lower in 2008 as compared to 2007, due to the mining of the relatively narrower areas at the final limits of the pit.

Total cash costs increased 20% to \$419/oz, a result of the reduced levels of production, a weakening in the dollar against the euro, and significant increases in fuel, mining contractor and certain reagent costs.

Capital expenditure of \$3 million (attributable \$1 million) in 2008 was spent on stay-in-business capital.

Growth prospects

Exploration work focused mainly on the creation of a 3D model and testing the applicability of recent interpretations to the broader permit area. The regional geological modelling and motivation for targeted areas drilling will be completed by December 2008. Drilling of key targets will commence in early 2009.

Outlook

From April 2009, Morila will only process stockpiles. Attributable production at Morila is projected to be around 130,000 ounces while total cash costs are forecast to increase to between \$550/oz and \$570/oz. Capital expenditure of \$10 million (\$4 million attributable) is planned for 2009, to be spent on the purchase of the mining fleet from the mining contractors.

Mali, Morila

Annual Report 2008

– 76 –

AngloGold Ashanti has one wholly owned gold mining operation in Namibia, Navachab. In 2008, Navachab produced 68,000 ounces of gold, equivalent to 1% of group production.

NAVACHAB

Description

Navachab Gold Mine an open-pit mine is situated near the town of Karibib, some 170 kilometres north-west of the capital Windhoek, and 171 kilometres inland on the south-west coast of Africa.

Safety

Safety, health and the environment are matters of key importance at Navachab. In 2008 the mine was both fatality and lost-time injury free. The improvement in safety performance was a highlight of 2008 and maintaining this track record is an aim of management.

Operating review

Gold production at Navachab declined by 15% to 68,000 ounces in 2008, largely a result of the significant production challenges encountered. This included the substantially reduced availability of drilling machines, with respect to both performance and capacity which affected mining throughput, as well as the shortage of skills which contributed to a decrease in tonnes broken for the year. In addition, underperformance at the North Pit 2 satellite pit, which had a budgeted contribution of 31% to plant feed, affected overall mine production negatively. The decrease in tonnes mined affected stockpile volumes and values, resulting in decreased mine flexibility and a decline in grades.

Capital expenditure for the dense media separation (DMS) plant was approved in 2008. Construction and commissioning of the DMS plant will begin in 2009 and the benefits resulting from its use will be realised from 2010 onwards.

 Annual Report 2008

- 77 -

Unit cash costs increased significantly, up 27% to \$534/oz, as compared to 2007, the result of increases in the

cost of labour, diesel and explosives, and compounded by the decline in gold production.

Growth prospects

Expansion work on the eastern pushback continues and the additional work on the superpit, which involves the expansion of the hangingwall of the main orebody, is a key aspect of the plan. The dense media separation (DMS) plant is to be incorporated into the mine's processing facilities at a cost of \$4.5 million (\$17 million was spent on this plant in 2008), and it is expected that this will accelerate production in the short term.

Outlook

Gold production for 2009 is projected to increase to approximately 70,000 at a total cash cost ranging from \$430/oz to \$450/oz. Capital expenditure of \$18 million is scheduled for 2009, to be spent on the DMS plant, rebuilding of major components of heavy mining equipment, replacement and upgrading of major components of the carbon-in-pulp plant, purchase of a drill rig and on exploration.

Namibia, Navachab

Annual Report 2008

– 78 –

AngloGold Ashanti has one gold mining operation in Tanzania, Geita, which produced 264,000 ounces of gold in 2008, equivalent to 6% of group production.

GEITA

Description

The Geita gold mine is situated 80 kilometres south-west of the town of Mwanza in the north-west of Tanzania. The Geita gold deposit is an Archaean mesothermal orebody, largely hosted in a banded ironstone formation. It is a multiple open-pit operation with further underground potential which is currently serviced by a 5.2Mt per annum carbon-in-leach (CIL) processing plant.

Safety

Geita Gold Mine is OHSAS 18001 certified. The lost-time injury frequency rate for 2008 was 0.86 per million hours worked. No fatalities were recorded during the year.

Operating review

Production at Geita declined by 19% to 264,000 ounces in 2008. Lack of access to higher-grade orebodies following the collapse of the Nyankanga Pit in the first quarter of 2007 continued to have an effect on recovered grades which declined to 1.92g/t. Process plant throughput was seriously affected by a 30-day shutdown of the SAG mill during part of September and October resulting in a halving of production for that period.

Global Inflation impacted the entire business. Major contributors to the 55% increase in total production costs of \$929/oz included the price of oil, which affected on-site power generation and the running costs of heavy earth-moving equipment, as well as that of spares and reagents. Although a substantial increase in basic salaries was enforced, the total number of employees was reduced through natural attrition by 9% for the year with further consolidation of functions envisaged in the future. In addition, a fourth shift was introduced in the production arena, which had the effect of reducing overtime requirements by some 90%.

Capital expenditure of \$53 million, double that of 2007, was spent on the purchase of heavy mining equipment and exploration costs.

Growth prospects

Exploration

Exploration activities during 2008 focused on strike additions at the Area 3, Star & Comet, Kalondwa Hill and Lone Cone deposits, together with the detection of regolith gold anomalies below laterite cover via air core

drilling at Matandani NW. Results suggest, the potential for a 1.7 kilometre zone of gold mineralisation on-strike at Area 3, and infill drilling to prove up the resource continues. To assist future exploration, an airborne geophysics survey of the areas covered by Geita's licences and adjacent prospecting licences started in the third quarter. Early interpretation of transient electromagnetic data defined several targets which will be followed up in 2009. During the third quarter of 2008, An intense programme of advanced grade control was completed at Nyankanga cut 5 to increase confidence in the production forecast for 2009.

New pits

While the Star & Comet pit was commissioned during 2008, the Lone Cone pit was depleted. Pushback 5 in the Nyankanga pit will start yielding ore during the first quarter of 2009, together with the Star & Comet; these two pits will be the main sources of ore in 2009. The Geita Hill pit will provide the background tonnes, albeit at a much lower grade.

Metallurgy

Test work continues to identify processing options regarding the refractory ore from Matandani and Kukuluma. These resources have significant potential, but require unconventional processing.

Outlook

Gold production in 2009 is forecast to increase to 315,000 ounces at a cost ranging from \$800/oz to \$820/oz as higher grade ore is intersected in the mining schedule. Capital expenditure of \$17 million is planned, which includes stay-in-business expenditure and exploration expenditure.

Annual Report 2008

– 80 –

Cripple Creek & Victor Gold Mining Company (CC&V) is AngloGold Ashanti's sole active operation in the United States. In 2008, Cripple Creek & Victor produced 258,000 ounces of gold, 5% of group production.

Description

Located in the State of Colorado in the United States, CC&V's Cresson mine is a low-cost, open-pit mining operation which treats the ore mined by means of a heap-leach pad, which is one of the largest in the world. Production began here in 1994.

CC&V is a joint venture in which two AngloGold Ashanti entities now collectively own 100% after the successful acquisition, effective 1 July 2008, of Golden Cycle Gold Corporation, which previously held a 33% interest in CC&V. On 14 January 2008, AngloGold Ashanti announced the execution of an agreement and plan of merger to acquire 100% of Golden Cycle Gold Corporation, thus consolidating 100% ownership of CC&V. The closing of that transaction was completed with effect 1 July 2008 after approval by Golden Cycle Gold Corporation's shareholders, the satisfaction of certain closing conditions, and the receipt of all necessary regulatory approvals.

Safety

The LTIFR for 2008 was 4.83 per million hours worked (2007: 2.53) and there were no fatalities during the year. Various safety programmes (e.g. DuPont Safety Training (STOP) programme in 2003, risk-based safety management system in 2005, and extension of the STOP programme, called Train the Trainers, in 2007) have been implemented to continue to enhance safety performance at CC&V. A cultural assessment of the workforce by SAFEmap was initiated in 2008 with risk identification classes beginning in the latter part of 2008 and continuing into early 2009. The SAFEmap system will be adapted for use as the safety programme at CC&V.

Annual Report 2008

– 81 –

Operating review

In 2008, production at CC&V fell 9% to 258,000 ounces. A total of 24.4Mt were placed on the heap-leach pad. The decline in production was principally a result of the slow percolation in the gold-bearing leach in the leach pad as a result of the greater distance over which the gold-bearing-leach solution had to be transported from the

higher stacked ore to the leach-pad liner. This decline was compounded by a lack of alkalinity at depth that was identified from the 2008 pad drilling programme. This deficiency caused solubilised gold to precipitate at depth. An initiative to increase alkalinity by increasing caustic and lime addition over the pad began in the second half of 2008 and will continue into 2009. Given the size of the pad, recovery of precipitated gold is expected to continue for the next two years.

Overall, there was an increase in total cash costs of 15% to \$309/oz, mainly as a result of rising commodity costs, and of diesel fuel in particular. A decrease in costs due to lower contractor costs was diminished by increases in fuel costs as oil prices hit record levels on global markets and inflation in the general US economy. Capital expenditure for the year amounted to \$27 million (2007: \$23 million) spent mainly on new equipment and exploration.

Growth prospects

CC&V was successful in being granted the required permits from the State of Colorado and Teller County for a mine-life extension that includes the development of new sources of ore and an extension to the heap-leach facility. The approvals extend the operation of the expanded valley leach facility and the chemical closure activities. Development drilling has further defined areas of interest for which engineering analysis and permitting requirements will be evaluated in a pre-feasibility study to be commissioned in 2009.

Outlook

Gold production for 2009 is projected to increase to around 280,000 ounces at a total cash cost ranging from \$350/oz to \$370/oz. Operational initiatives will continue to be taken to minimise growth in the leach-pad gold inventory in 2009. Capital expenditure of \$77 million is scheduled for 2009, to be spent mostly on major mine equipment purchases and the mine-life extension project.

GOLD

PRODUCTS AND MARKETING CHANNELS

Gold accounts for 98% of AngloGold Ashanti's revenue from product sales. The balance of product sales is derived from sales of silver, uranium oxide and sulphuric acid. AngloGold Ashanti sells its products on international markets.

Gold produced by AngloGold Ashanti's mining operations is processed to a saleable form at various precious metals refineries. Once refined to a saleable product – generally large bars weighing approximately 12.5 kilograms and containing 99.5% gold, or smaller bars weighing 1.0 kilograms or less with a gold content of 99.5% and above – the metal is sold either through the refineries' channels or directly to bullion banks and the proceeds paid to the company. Bullion banks are registered commercial banks that deal in gold. They participate in the gold market by buying and selling gold and distribute physical gold bullion bought from mining companies and refineries to physical offtake markets worldwide. Bullion banks hold consignment stocks in all major physical markets and finance these consignment stocks from the margins charged by them to physical buyers, over and above the amounts paid by such banks to mining companies for the gold.

Where forward sales contracts exist against which AngloGold Ashanti delivers physical product, the same channel of the refinery is used. In this case, the refinery does not sell the metal on the company's behalf, but instead delivers the finished gold bars to the bullion bank with which the group's forward contract is held. The physical delivery to the counterparty bank of the appropriate amount of gold fulfils AngloGold Ashanti's obligations under the forward contract, and AngloGold Ashanti is paid for this gold by the relevant bullion bank, at the price fixed under the forward contract, rather than at the spot price of the day.

GOLD MARKET CHARACTERISTICS

Gold price movements are largely driven by macro-economic factors such as expectations of inflation, currency fluctuations, interest rate changes or global or regional political events that are anticipated to impact on the world economy. Gold has played a role historically as a store of value in times of price inflation and economic uncertainty. This factor, together with the presence of significant gold holdings above ground, tends to dampen the impact of supply/demand fundamentals on the market. Trade in physical gold is, however, still important in determining a price floor, and physical gold, either in the form of bars or high-caratage jewellery, is still a major investment vehicle in the emerging markets of India, China and the Middle East.

Gold is relatively liquid compared to other commodity markets and significant depth exists in futures and forward gold sales on the various exchanges, as well as in the over-the-counter market.

64%

23%

11%

A design from the recent AngloGold Ashanti

AuDITIONS collection, 'Trendsetting Gold'.

TRENDS IN PHYSICAL GOLD DEMAND

Physical gold demand is dominated by the jewellery industry and the investment sector, which together account for almost 90% of total demand. The balance of gold supply is used in dentistry, electronics and medals.

While the quantity of gold used in jewellery consumption has decreased over the last decade, the investment market has largely taken up available supply. Investment in physical gold includes bar hoarding, coins, medals and other retail investment instruments as well as exchange traded funds (ETFs), which have, since their inception in 2002, become well established as a vehicle for both retail and institutional investors and are now the sixth largest holder of gold, after the major central banks and the International Monetary Fund (IMF). Newly-mined gold is not the only source of physical gold onto the market, and in fact accounts for just over 60% of supply. Due to its high value, gold is rarely destroyed and some 161,000 tons of gold (approximately 65 years of new mine supply at current levels) is estimated to exist in the form of jewellery, official sector gold holdings (central bank reserves) and private investment.

In 2008, gold was supplied onto the market from newly-mined production (2,385 tons), sales of gold by central banks (485 tons) as well as from sales of scrap gold (977 tons), largely from the jewellery trade

(1)

GOLD DEMAND BY SECTOR

Jewellery demand

Geographically, just less than 80% of gold jewellery demand now originates in emerging markets, in comparison to 64% a decade ago. The major markets for gold jewellery are India, China, the Middle East and the United States. The Russian market has also seen recent strong growth, and was the sixth largest single market for gold jewellery in 2008, with demand at just under 100 tons.

In the economies of India and the sub-continent, gold jewellery is purchased as a quasi-investment product. High-caratage jewellery is sold at a relatively small margin to the spot gold price, which is generally transparent to the consumer, and is therefore easily re-sold to jewellers or bullion traders when cash is required or when the jewellery is out of date and needs to be refashioned.

Data Source: GFMS, World Gold Council.

India accounts for more than 20% of global gold jewellery demand and is by far the largest market for gold in jewellery. It also accounted for more than 20% of identifiable investment demand in the sector in 2008. Total bullion imports to India, though they may fluctuate significantly according to price movements during the year, have risen steadily over the last decade.

The characteristics of the gold market in the Middle East are similar, although an important difference is the exceptionally high per capita ownership of gold in some of the countries of that region. In the United Arab Emirates, for example, consumption per capita is some 30 times that in the US or the UK and some 50 times higher than in India.

The Middle Eastern market accounted for over 300 tons of gold demand in 2008 or approximately 15% of the global total. Turkey, Saudi Arabia and the United Arab Emirates are the largest consumers within this market.

In China, approximately 80% of gold is sold in the form of high caratage jewellery which is easily traded, similarly to the Indian and Middle Eastern markets. The balance of gold in China is sold in the form of 18 carat jewellery. Although introduced to the market only in 2002, sales in this category of jewellery have grown quickly due to its appeal to a rapidly-growing market segment of young, independent urban women.

An important feature of the Chinese market in recent years has been the relatively stable nature of gold demand, particularly in comparison to the Indian and Middle Eastern markets, where volatility typically causes price-sensitive consumers to hold back on jewellery purchases.

The US market accounted for approximately 180 tons of jewellery demand in 2008, just over 8% of the global total. Gold in the USA is purchased largely as an adornment product and purchase decisions are dictated by fashion rather than the desire to buy gold as an investment. The intrinsic value of gold as a store of value does still, however, play a role in the purchase decision process.

Investment demand

As well as holdings in ETFs, which have become a well-recognised investment vehicle for gold, primarily in the US and European markets, physical gold investment takes the form of bar hoarding (primarily in India and in China) and official coins (for which the largest market is Turkey).

Physical investment demand has grown significantly since 2003, when it stood at just less than 300 tons, to levels of approximately 770 tons in 2008. Over the course of 2008, demand increased in all of the various retail investment categories, and particularly in ETFs. Holdings in the latter increased from 28 million ounces (approximately 870 tons) to 38 million ounces (approximately 1,180 tons), an increase of 36% over the year. This significant increase in ETF holdings, which has continued post year-end, reflects growing concern over the global financial system and a flight to gold as a 'safe-haven' asset.

Industrial and other sectors

The largest industrial use of gold is in electronics, as plating or bonding wire. In line with the growth in the use of personal computers and other electronic instruments globally, the use of gold in this sector has also increased, averaging a growth rate of over 9% in the five-year period from 2002-2007. The overall quantity of gold used in this sector, however, remains small, at only 11% of total demand.

Annual Report 2008

– 84 –

The gold
and uranium markets *cont.*

Demand for gold for dentistry purposes continues to decline, however this constitutes only a small portion of total demand, less than 2% of the global total.

Central bank holdings, sales and purchases

Gold held by the official sector, essentially central banks and the IMF, stood at approximately 29,000 tons in 2008. Periodically, central banks buy and sell gold as market participants. Most central bank sales take place under the Central Bank Gold Agreements (CBGA) and therefore without any significant impact on the market. The second of these agreements is currently in its fifth and final year (which ends at the end of September 2009). Central bank sales in the fourth year of the agreement, which ended on 27 September 2008, reached only 343 tons, against the quota of 500 tons available under the agreement. Sales in the first quarter of the current year of the agreement reached only 50 tons, and it therefore seems likely, under current circumstances, that the annual CBGA quota will not be reached.

At this time it seems likely that the current CBGA will be renewed and, that if, any gold sales by the IMF (as recommended by the IMF's Eminent Persons' Committee to support the bank's financial position) will also take place within the framework of the agreement. The process of finalising IMF sales does, however, require US Congressional approval and is therefore likely to be lengthy given the priorities facing the new US administration.

ANGLOGOLD ASHANTI'S MARKETING SPEND

AngloGold Ashanti has since its inception been committed to growing the market for its product. The company's marketing programmes aim to increase the desirability of gold to sustain and grow demand. AngloGold Ashanti is an active member of the World Gold Council, and AngloGold Ashanti's subscription to the World Gold Council accounts for the bulk of the company's marketing spend. The company remains involved in independent projects to grow jewellery demand, in partnership with companies such as Tanishq (a subsidiary of the Tata Group) in India. It has also supported the development of gold concept stores in China, under the 'Just Gold' brand. AuDITIONS, the company's own global gold jewellery design competition brand, continues to grow and has become a well-recognised corporate marketing tool. See the competition website at www.goldditions.com/

Annual Report 2008

A design from the recent AngloGold Ashanti AuDITIONS collection, 'Hyper Nature'.

THE URANIUM MARKET IN 2008

AngloGold Ashanti's uranium production is sold via a combination of spot sales and long-term agreements.

The spot price for U

3

O

8

was volatile during 2008. The year opened with a spot price of some \$90/lb, declining to an annual low of \$44/lb in mid-October and recovering to \$53/lb by the end of the year. The long-term U

3

O

8

price began the year at \$95/lb and remained stable until the end of April when it began to decline, reaching the year-end price of \$70/lb. Long-term prices have not shown the same level of volatility as spot prices.

The significant volatility and overall decline in the spot price were driven by low levels of demand in the early part of the year, followed by the impact of the financial crisis in latter months that caused financial players to sell off their uranium inventories with some urgency to improve liquidity. The year-end recovery in prices was most likely caused by unanticipated additional spot demand from China, and may continue on the back of potential demand from India.

The declining spot price has had significant implications on near-term primary supply for uranium producers, and in several cases has made it uneconomical for these producers to continue production. Notably, several projects in the United States and South Africa have been curtailed or postponed, and some in Canada and Kazakhstan are experiencing technical or production difficulties. This may result in a tightening of supply in the short to medium term. However, the medium-to long-term indicators show that there is potential for increases in supply through expansion plans, new discoveries of mineralisation zones and more amenable regulatory environments, particularly in Australia, Russia and Namibia.

Details on secondary supplies from the US also became clearer in 2008 with the Domenici Amendment becoming law in late September 2008. This places limits on imports of low enriched uranium from Russia to about 20% of annual US nuclear reactor requirements between 2014 and 2020. The US also published its uranium inventory disposal plan and capped disposals at 10% of annual US reactor requirements, and will make available up to an additional 20 million pounds of uranium for supplying into initial core programmes of new reactors from 2010 onwards.

On the demand side, there continue to be calls from several countries to increase the proportion of nuclear power supply in their fuel mix to reduce dependence on expensive coal and oil imports and to reduce emissions. According to the International Atomic Energy agency (IAEA), more than 50 countries are considering nuclear power. However, the financial crisis may temper this demand and cause delays to new projects due to lack of available finance.

The long-term outlook for uranium prices remains positive due to continuing forecasts of strong demand and the expectation of continued challenges on the primary supply side. In particular, following the signing of the '123 Nuclear co-operation agreement' between India and the US, demand from India is likely to appear on the spot market.

Annual Report 2008

The gold

and uranium markets *cont.*

Total exploration expenditure in 2008 amounted to \$183 million, of which \$77 million was spent on greenfield exploration, \$86 million on brownfield exploration and the balance of \$20 million on pre-feasibility studies. The main aim of both the greenfield and brownfield exploration programmes is to identify new attributable resource ounces of gold.

GREENFIELD EXPLORATION

Greenfield exploration activities were undertaken in six countries – Australia, China, Colombia, the Democratic Republic of Congo (DRC), the Philippines and Russia – during 2008. A total of 304,371 metres of diamond, reverse circulation, and aircore drilling was completed in testing existing priority targets and in the delineation of new targets in Australia, Colombia, Russia, the DRC and China (refer to figure below).

Greenfield activities in Russia, China and the Philippines were undertaken predominantly through joint ventures and strategic alliances. While the discovery of new long-life, low-cost mines remains the principal aim of the greenfield exploration programme, AngloGold Ashanti is also committed to maximising shareholder value by divesting those exploration assets that do not meet its internal growth criteria and by opportunistically investing in prospective junior exploration companies.

During the year to 31 December 2008, a total of 13.26 million attributable ounces of Measured, Inferred and Indicated Mineral Resources were defined and announced by AngloGold Ashanti's greenfield exploration teams at two prospects – Tropicana (Western Australia) and La Colosa (Colombia) (see table on page 88).

*At a gold price of \$1,000/oz

In the last three years the average discovery cost per ounce of greenfield exploration was \$10. At La Colosa, specifically in 2007 and 2008, the discovery cost per additional ounce of gold was \$1.

In 2009, exploration expenditure of some \$146 million is planned, with \$90 million of this budgeted to be spent on greenfield exploration with the remaining \$56 million allocated to a pre-feasibility study at La Colosa in Colombia.

Colombia

Drilling and resource modelling at La Colosa has rapidly defined a gold porphyry system with a grade of more than 0.3 g/t Au extending over a strike length in excess of 1,500 metres and a width of 600 metres, which has defined an Inferred Mineral Resource of 381.4Mt @ 1.00g/t Au for 12.3 million ounces of gold at a gold price of \$1,000/oz and a lower cut-off of 0.3g/t Au.

Global

exploration *cont.*

Based on present drilling and geochemical observations, the La Colosa mineralisation systems, including the La Belgica sector, remain open to the north, south and east. Various additional targets immediately surround the known La Colosa mineralisation. This is the first significant gold porphyry discovery in the Colombian Andes, where AngloGold Ashanti has first mover advantage with granted and application tenements covering an area of some 61,700 square kilometres, with significant potential to increase the Mineral Resource at La Colosa and at other projects.

The La Colosa drill programme was suspended in late February 2008 in order to comply with unexpected environmental requirements. All of the necessary documentation has been submitted to the relevant authorities for approval.

AngloGold Ashanti and its partners actively explored for precious and base metal deposits. In all, 294 targets were generated by systematic exploration in an area covering 4.2 million hectares, on 408 mineral tenement contracts, joint venture partner B2Gold Corp. continued resource delineation drilling at Gramalote, first phase drilling at Quebradona and continued reconnaissance and drill target definition work in three departments in Colombia. Mineros S.A. drilled one target in Antioquia and conducted reconnaissance and drill target definition work at two other targets within the Segovia joint venture in the Antioquia department. Significant results were released from the Quebradona gold-copper porphyry project that are likely to increase the Mineral Resource at this project.

On receipt of all assay and geological data for the AngloGold Ashanti/B2Gold JV Quebradona drilling programme, AngloGold Ashanti has a period of 30 days in which to decide on its level of future participation in the project (49%, 51% or 65% interest). Glencore International remained focused on early stage exploration and conducted airborne geophysical surveys within joint venture areas.

AngloGold Ashanti activities during the year also included flying in-house airborne magnetometry and radiometric surveys for a total of 11,463 line kilometres.

Exploration, Colombia

Democratic Republic of Congo

Exploration activities undertaken on the 10,000 square kilometre Concession 40 (AngloGold Ashanti 86.22% and OKIMO 13.78%) mineral claim that encompasses most of the Kilo greenstone belt and which remains largely unexplored by modern methods, included both regional work and additional drilling at and around the Mongbwalu resource. Around Mongbwalu, detailed surface mapping and data integration are enhancing understanding of the immediate area's potential. At the Issuru prospect, located approximately 4 kilometres north of Mongbwalu, drilling defined potential economic mineralisation over a strike length of approximately 800 metres and a width of up to 450 metres.

Regional exploration activities focused around four main areas including Lodjo, Bunia West, Mount Tsi and Petsi, all of which are all located within 50 kilometres of the Mongbwalu resource area. Field work concentrated on detailed mapping, soil sampling and trenching. Encouraging results were obtained from trench sampling at Lodjo. At the Petsi prospect, a 30 metres wide potentially gold mineralised shear zone has been identified by trenching over a distance of 1.8 kilometres. Results from infill soil sampling define an anomaly approximately 450 metres wide and 300 metres long. Regional aeromagnetic (5,550 square kilometres) and aerial EM surveys (1,224 square kilometres) were completed. Results of these surveys, combined with those from the regional geochemistry programmes, will provide the platform from which to fast-track regional exploration over the concession.

The findings of the DRC Minerals Review Commission have resulted in AngloGold Ashanti and the AGK joint venture engaging the DRC government to seek resolution and secure the rights to Concession 40. Exploration activities over the Concession 40 licence were suspended in November 2008 following the deteriorating security situation which led to the precautionary withdrawal of most non-essential staff from the concession.

Russia

The formation of Zoloto Taigi, the AngloGold Ashanti/Polymetal strategic alliance vehicle was completed. It is anticipated that this strategic alliance will enable AngloGold Ashanti to increase its presence in Russia by pursuing new opportunities by participating in licence auctions, acquiring equity in prospective projects and by project generation in new or less intensely explored areas. Exploration work to increase and upgrade the resource economics at Veduga was undertaken. Trenching and drilling at this advanced project have demonstrated strike continuation of mineralisation from the south-eastern ore zone for a further 500 metres along strike. At the recently acquired Penchenga property, regional soil geochemistry has begun. The

Exploration, DRC

Bogunay project (42 square kilometres) was sold while negotiations on the sale of Anenskoye (11.8 square kilometres) and Aprelkovskoye (161 square kilometres) continue.

Africa

During 2008, greenfield activities in Africa concentrated on project reviews and regional target generation work in west, central and east Africa. The intention is to increase the level of greenfield exploration in Africa over the next two years.

Philippines

Final approval of the Mapawa Mineral Production Sharing Agreement (MPSA) is awaited from the Department of Environment and Natural Resources (DENR) in Manila. Elsewhere in south-east Asia specific project reviews and project generation work continue.

China

In China, AngloGold Ashanti operates three co-operative joint ventures (CJVs) with local partners at Yili-Yunlong (Xinjiang Province), Jinchanggou (Gansu Province) and Pingwu (Sichuan Province). During 2008, AngloGold Ashanti withdrew from the Pingwu CJV at the time of the devastating Sichuan earthquake.

At the Jinchanggou CJV Project (Gansu Province), soil sampling on the eastern and western tenements indicated significant extensions to known mineralisation with anomalous gold-in-soils over more than a 16 kilometre strike length. Final approval for the Jinchanggou CJV was received from the Gansu government in late June. A subsequent programme of diamond drilling and trenching designed to test the 16 kilometre long gold-in-soil anomaly was completed at the Jinchanggou project in December. Despite intersecting significant intervals of intense alteration and shearing in drilling, analytical results were disappointing.

Results from the diamond drilling programme completed in 2007 to test a conceptual porphyry target on the tenements held by the Yili-Yunlong CJV (Xinjiang Province) returned low gold and copper results. Results of follow-up work on other targets defined by soil sampling and geological mapping, and the investigation of geochemical anomalies coincident with silica-clay alteration, has led to the prospectivity of the area being downgraded.

An intense phase of project generation undertaken in China in 2008 resulted in tenement applications being lodged in three provinces of China; Xinjiang, Inner Mongolia and Heilongjiang.

Australia

In mid 2008, exploration at the Tropicana joint venture (AngloGold Ashanti 70%, Independence Group 30%) moved from a focus on resource drilling of the Tropicana-Havana deposit within the Tropicana Gold Project, to initial testing of targets within potential trucking distance of the planned operation. A large number of discrete targets have been identified within a 50-60 kilometre radius of the proposed plant site (see map).

Field mapping and rock chip sampling at the Black Dragon and Voodoo Child prospects identified outcropping gold mineralisation. Analysis of rock chip sampling from Black Dragon returned high-grade gold and silver results. Subsequent reverse circulation drilling has not explained these surface results. A large geochemical gold anomaly (3 kilometre by 1 kilometre) has been defined at the Kamikaze prospect with encouraging results at the Tumbleweed prospect situated to the north of the resource area. Reverse circulation drilling returned significant results from several other prospects including Rusty Nail and Screaming Lizard.

Initial diamond drilling at Beachcomber, approximately 200 kilometres to the south and within the Tropicana joint venture area, intersected quartz veining with visible gold.

Annual Report 2008

In addition to the Tropicana joint venture area, which totals approximately 12,500 square kilometres, AngloGold Ashanti holds 100% of a substantial land package (~6,764 square kilometres) in the Viking area. Most of the tenements in the Viking project are recent applications, with some tenements having been granted in late 2008. Field activities will begin in 2009.

The recently acquired Bronco Plains joint venture (AngloGold Ashanti earning 50.4%), hosts an approximately 10 kilometre-long gold-in-soil anomaly peaking at 86 ppb gold. In terms of the joint venture agreement with Image Resources, AngloGold Ashanti and Independence Group can earn a combined 72% interest in the project by spending \$2 million.

The Tropicana joint venture, Bronco Plains joint venture and the Viking project cover a total distance of 600 kilometres along the margin of the Yilgarn Craton. The 5 million ounce Tropicana discovery, numerous prospects identified by AngloGold Ashanti and promising results reported by other explorers give credence to the Tropicana belt being a strike-extensive new gold province.

BROWNFIELDS EXPLORATION

Brownfields exploration, aimed at identifying replacement ounces for production, was undertaken around the globe at most current operations- with the most success being in South Africa, Australia, Ghana and Guinea. The brownfields exploration programme for 2008 was aimed at replacing ounces at current operations and successfully added a total of 27.5 million ounces to the company's Mineral Resource.

Argentina

At Cerro Vanguardia, reconnaissance drilling continued with 45 kilometres of veins being explored via 454 reverse circulation (RC) holes. This drilling identified 17 veins for infill drilling in 2009. While infill drilling (8,075 metres RC and 11,457.5 metres diamond drilling) extended some of the current ore shoots and added 0.28 million ounces of gold and 7.9 million ounces of silver to the Mineral Resource.

During the year, a hyperspectral survey was completed over the lease area. A new area, El Volcán, was permitted in 2008 and initial exploration activities have commenced. Deep level drilling (+300 metres) to explore the depths of current veins for underground potential began during the year. Initial results are encouraging.

Tropicana, Australia

Australia

At Sunrise Dam, exploration focused on increasing the underground gold Mineral Resource to enable increased production in 2009 and 2010 while defining long-term zones of gold mineralisation up to 1.25 kilometre vertically below the mine. Additionally, short-term opportunities for satellite open pits within the immediate mine area were also investigated. During the period 41,417 metres of diamond core was drilled from 297 drill holes with 8,873.1 metres drilled into the deep targets.

At Boddington Gold Mine, a maximum of five diamond drill rigs were employed during the year to complete a total of 101,700 metres of drilling in 141 holes targeting in-pit Mineral Resource conversion and near-pit Mineral Resource extensions. By the end of 2008, attributable Ore Reserves were increased by 1.1 million ounces to 6.7 million ounces and Mineral Resources increased by 1.6 million ounces to 11.9 million ounces of contained gold. Subsequent to year-end, AngloGold Ashanti disposed of its interest in Boddington to Newmont.

Brazil

At Córrego do Sítio, drilling of underground deposits continued. A total of 37,865 metres were drilled from surface and 10,142 metres from underground during 2008. Furthermore 3,482 metres of underground development, of which 1,107 metres were on reef, was completed. Drilling concentrated on the Carvoaria, Laranjeiras and the Cachorro Bravo orebodies. Minor drilling (2,491 metres) was completed on surface oxide deposits. At Lamego, a total of 22,782 metres were drilled from surface and 17,632 metres from underground. Furthermore a total of 4,063 metres of underground development, of which 1,428 metres were on reef, was completed. The drilling consisted of a combination of intermediate depth surface drilling targeted at the extensions of the Cabeça de Pedra and Arco da Velha orebodies, underground extension drilling of Queimada and surface and underground infill drilling at Carruagem.

On 10 December 2008, the purchase of the São Bento mine was completed. This area will be the focus of significant exploration in 2009.

At Serra Grande, the main targets for 2008 were Pequidão and Palmeiras. A total of 37,000 metres of diamond drilling was completed.

Ghana

At Obuasi, drilling for the Deeps project below 50 level continued with the areas below KMS and Adansi Shafts being targeted from 50 level. Active exploration continued above 50 Level.

At Iduapriem, drilling for the year consisted of Mineral Resource conversion drilling at Ajopa with a combination of RC (10,765 metres) and diamond drilling 3,127 metres). The programme was completed in December and sampling and logging of the diamond core is currently being completed.

Guinea

At Siguiri, early stage exploration in the form of gridded geochemical sampling was conducted in Block 1 (Eureka North – Kintinian corridor and Sintroko South), Block 2 (Manguity and Saraya South), the Naboun Block (28 kilometres north of the mine) and the Corridor Block (11 kilometres from the mine). Reconnaissance air core drilling was undertaken at Satiguia, Manguity (35 kilometres west of the mine), Kouremale (Block 4) and Kolita-Kounkoun (Block 3). Mineral Resource Delineation drilling was conducted at Saraya (55 kilometres west of the mine). Mineral Resource conversion drilling was completed at Sintroko South (8 kilometres south of the mine) and added 0.7 million ounces to the Mineral Resource and allowed for the conversion of 0.7 million ounces to Ore Reserve. Infill drilling was completed on the margins of the Séguélen (Kintinian) project.

Annual Report 2008

A major review of the geology of Block 1 conducted during the year indicated significant upside to the mineralisation. A project which has been launched to remodel the Mineral Resource while at the same time drilling out areas of postulated strike and dip extensions to mineralisation. Initial drilling of hard rock mineralisation below the current pits has provided positive results and this drilling will continue in 2009.

Mali

At Morila, only minor field work was conducted during the year with some pitting and trenching. However a significant amount of core logging and pit mapping was completed. This led to a revised geological model, including lithological overview, tectonic setting and magmatism, being developed during the year. A revised exploration programme proposal is now under consideration.

At Sadiola, exploration work in 2008 concentrated on testing targets defined in the 2007 exploration workshop. A total of seven targets were tested (15,978 metres air core and 5,164 metres of diamond drilling).

Phase 9 of deep sulphide drilling was carried out to the north of the main pit to test the continuity of the mineralisation intersected by previous drilling to the south. A total of 11 diamond holes were drilled (4,420 metres). This was followed by the Phase 10 drilling programme which was undertaken to collect samples for metallurgical test work. This drilling programme comprised seven long holes and 12 wedges drilled from outside the main pit, and seven short holes inside of the pit (6,118 metres).

Sulphide reconnaissance drilling (2,125 metres) was done at the FE4 pit. The programme was initiated to collect geological and structural information as well as to test for the possibility of sulphide mineralisation.

Mineral Resource delineation drilling was conducted at Lakanfla East (5,650 metres) and Sekokoto SE (1,562 metres). Mineral Resource conversion drilling was concentrated at Sekokoto Main (6,515 metres) and FE3S – Gap Area (6,368 metres).

A geophysical survey ground penetration radar test (GPR) was done between FE3 and FE4 to test the efficacy of this method in predicting the thickness of the laterite cover.

At Yatela, a number of boreholes were drilled to test the continuity of the north-west extension mineralisation at depth (1,107 metres). Reconnaissance drilling (4,632 metres) at Donguera indicated some thin mineralised zones. At Dinguilou, a small Mineral Resource conversion programme was completed (3,674 metres) and the Mineral Resource definition programme was completed at year-end. Two small areas of Alamoutala were infill drilled (3,978 metres) after optimisation of the pit showed upside potential. An infill programme was completed at Niamoulama Hill late in December and results are still outstanding. A programme to explore gravity lows in the vicinity of Yatela was started and two holes (218 metres) were completed by year-end.

Namibia

At Navachab, geochemical soil sampling was conducted over the footwall of the Mon Repos Thrust zone (200 samples), the Zebra target (1,762 samples) and the Ostrich and Giraffe targets. Stream sediment sampling was completed over the Okondura licence area with disappointing results. Some initial drilling was completed at the Steenbok and Starling targets. Mineral Resource conversion drilling (15,426 metres) was completed in two phases at Anomaly 16, and at Gecko 11, 868 metres was drilled. Additional Mineral Resource conversion drilling (29,376 metres) was completed around the Main Pit and North Pit 2. A Spectrum electromagnetic survey was flown in November and the interpreted results are expected in early January.

Annual Report 2008

– 94 –

Global
exploration *cont.*

South Africa

Surface drilling continued in the Project Zaaiplaats area, where the target is the Vaal Reef.

A long deflection to the east is in progress in MZA9. The deflection reached a depth of some 2,941 metres when technical issues stopped the advance of the hole. The drilling contractors are trying to reopen the hole.

MMB5 is drilling in the north-west of the main Zaaiplaats block. Due to in hole problems a new deflection was started at 1,702 metres. By the end of the year, the long deflection had reached a depth of 3,172.55 metres.

The Vaal Reef was not intersected as expected, due to faulting. Further deflections will be drilled in 2009.

A new hole, MGR8, was started during the year and continued with record excellent advances. By the end of the year the hole had advanced to a depth of nearly 1,596 metres.

Two surface boreholes in the Moab North area continued drilling into 2008. The targets were proposed Vaal Reef blocks in a poorly-defined, structurally complex area, north of the 'Middle Mine' area. MCY5 reached a depth of 3,129.49 metres. The Vaal Reef was not intersected, but the geological information from the hole was used to define a revised and more complex structural model.

Borehole MCY4 obtained a faulted C Reef intersection at some 2,823 metres. By year-end, the long deflection in MCY4 had reached a depth of almost 3,003 metres.

Borehole G55 at Tau Lekoa was drilled to follow-up on G54. The hole was stopped at 1,513 metres, having intersected a large fault at 1,384 metres.

Tanzania

At Geita, exploration activities focused on data compilation and re-interpretation, and target generation. This work was supplemented by two major geophysical airborne surveys: a high-resolution AeroTEM survey and a high-resolution airborne magnetic survey. A major exploration workshop was held on site and involved technical specialists from greenfields exploration. The outcome of this workshop was a revision to the 2009 programme.

During the year reconnaissance drilling was completed at Nyakabale West where six diamond holes were drilled (1,555 metres). At Matandani, 45 air core holes (4,080 metres) were drilled to investigate the possibility of the Matandani mineralisation being developed further to the north-west. A total of 27 reverse circulation holes (2,498 metres) were drilled on the Nyankumbu licence area.

A small follow up programme was drilled (4,015 metres) at Star and Comet after sterilisation drilling showed an anomalous intercept. No continuity of mineralisation could be determined.

United States

At Cripple Creek & Victor in Colorado, drilling continued during the year and concentrated on the Main Cresson area, North Cresson, Schist Island, Wild Horse, Squaw Gulch and an area near the old Victor Pads. Exploration drilled a total of 85,923 metres in 416 holes.

A high-grade study which included close-spaced drilling on several targets and a selective mining test of one of the zones was started. The results were encouraging as drilling on tighter centres raised the average grade of two out of three targets and the selective mining test showed the high-grade zones could successfully be predicted, modelled, and mined.

Annual Report 2008

Ore Reserves and Mineral Resources are reported in accordance with the minimum standards described by the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code, 2004 Edition), and also conform to the standards set out in the South African Code for the Reporting of Mineral Resources and Mineral Reserves (SAMREC 2000 Code). Mineral Resources are inclusive of the Ore Reserve component unless otherwise stated.

MINERAL RESOURCES

The 2008 Mineral Resource increased by 40.5 million ounces before the subtraction of depletion. After a depletion of 7.2 million ounces, the net increase is 33.4 million ounces to give a total Mineral Resource of 241.0 million ounces. Mineral Resources were estimated at a gold price of \$1,000/oz (2007: \$700/oz). The increased gold price resulted in 13.3 million ounces being added to the Mineral Resource while successful exploration and revised modelling resulted in a further increase of 27.5 million ounces. The remaining loss of 0.3 million ounces is the result of various other reasons.

ORE RESERVES

The 2008 Ore Reserve increased by 7.7 million ounces before the subtraction of depletion. After a depletion of 5.9 million ounces, the net increase is 1.8 million ounces to give a total Ore Reserve of 74.9 million ounces.

A gold price of \$720/oz was used for Ore Reserve estimates (2007: \$600/oz). The change in economic assumptions made from 2007 to 2008 resulted in the Ore Reserve increasing by 2.7 million ounces while exploration and modelling resulted in an additional increase of 5.0 million ounces.

Ore Reserves as at 31 December 2007

73.1

Reductions

TauTona

Carbon Leader ground between 123-126 levels was transferred to Mponeng. With the change to scattered grid mining, lower value estimates resulting from increased sampling and drilling resulted in reductions. These were partially offset by a higher mine call factor and the inclusion the Carbon Leader eastern block.

(1.5)

Geita

Mineral Resource model changes and the application of grade factors to mitigate low model confidence; cost increases

(1.4)

Great Noligwa

Transfer of the SV4 section to Moab Khotsong.

(1.3)

Other

Total of non-significant changes

(1.1)

Additions

Mponeng

Increased grades, the additional ground from TauTona 123-126 level and improved economics which allowed for the mining of Block 3 & 5.

2.8

Obuasi

The increase is due to a revised mine design and schedule.

1.3

Boddington

The growth in Ore Reserve is due to successful drilling and a higher gold price

1.1

Siguiri

The Seguelen NW and Sintroko deposits were upgraded from Inferred to Indicated Mineral Resource and the mining efficiency increased.

0.6

Other

Total of non-significant changes

BY-PRODUCTS

Several by-products are recovered as a result of the processing of gold Ore Reserves.

These include 0.19 million tonnes of uranium from the South African operations, 0.29 million tonnes of copper from Australia, 0.44 million tonnes of sulphur from Brazil and 35.7 million ounces of silver from Argentina. Details of by-product Mineral Resources and Ore Reserves are given in the Mineral Resource and Ore Reserve Report 2008, which is available either on the corporate website, www.AngloGoldAshanti.com, or on request from the contacts detailed at the end of this report.

EXTERNAL AUDIT OF MINERAL RESOURCE AND ORE RESERVE STATEMENT

During the course of the year and as part of the rolling audit programme, AngloGold Ashanti's 2008 Mineral Resources and Ore Reserves for the following operations were submitted for external audit:

- Mponeng
- TauTona
- Vaal River Surface Sources
- Iduapriem
- Navachab
- Sadiola
- Yatela

The company has been informed that the audit identified no material shortcomings in the process by which AngloGold Ashanti's Ore Reserves and Mineral Resources were evaluated. It is the company's intention to continue this process so that each of its operations will be audited every three years on average.

COMPETENT PERSONS

The information in this report that relates to Exploration Results, Mineral Resources and Ore Reserves is based on information compiled by the Competent Persons. These individuals are identified in the report. The Competent Persons consent to the inclusion of Exploration Results, Mineral Resources and Ore Reserves information in this report, in the form and context in which it appears.
